# Featherweight X10: A Core Calculus for Async-Finish Parallelism 

Jonathan K. Lee Jens Palsberg<br>UCLA, University of California, Los Angeles<br>\{jkenl, palsberg\}@cs.ucla.edu

#### Abstract

We present a core calculus with two of X10's key constructs for parallelism, namely async and finish. Our calculus forms a convenient basis for type systems and static analyses for languages with async-finish parallelism, and for tractable proofs of correctness. For example, we give a short proof of the deadlock-freedom theorem of Saraswat and Jagadeesan. Our main contribution is a type system that solves the open problem of context-sensitive may-happen-in-parallel analysis for languages with async-finish parallelism. We prove the correctness of our type system and we report experimental results of performing type inference on 13,000 lines of X10 code. Our analysis runs in polynomial time, takes a total of 28 seconds on our benchmarks, and produces a low number of false positives, which suggests that our analysis is a good basis for other analyses such as race detectors.

Categories and Subject Descriptors D. 3 Programming Languages [Formal Definitions and Theory]

## General Terms Algorithms, Languages, Theory, Verification

Keywords parallelism, operational semantics, static analysis

## 1. Introduction

Two of X10's [5] key constructs for parallelism are async and finish. The async statement is a lightweight notation for spawning threads, while a finish statement finish $s$ waits for termination of all async statement bodies started while executing $s$.

Our goal is to enable researchers to easily define type systems and static analyses for languages with async-finish parallelism, and prove their correctness. For that purpose we provide a Turingcomplete calculus with a minimal syntax and a simple formal semantics. A program in our calculus consists of a collection of methods that all have access to an array. The body of a method is a statement that can be skip, assignment, sequence, while loop, async, finish, or method call. If we add some boilerplate syntax to a program in our calculus, the result is an executable X10 program.

We call our calculus Featherweight X10, abbreviated FX10. Featherweight X10 shares a key objective with Featherweight Java [8], namely to enable a fundamental theorem to have a proof that is concise, while still capturing the essence of the proof for the

full language. Our hope is that other researchers will find it easy to work either with FX10 as it is or with small extensions that meet particular needs.

We demonstrate the usefulness of our calculus in two ways. First, we give a short proof of the deadlock-freedom theorem of Saraswat and Jagadeesan [17]. They considered a much larger subset of X10 but stated the deadlock-freedom theorem without proof. Second, we present a type system that solves the open problem of context-sensitive may-happen-in-parallel analysis for languages with async-finish parallelism. We prove the type system correct and then discuss our experience with type inference.

The goal of may-happen-in-parallel analysis is to identify pairs of statements that may happen in parallel during some execution of the program. May-happen-in-parallel analysis is also known as pairwise reachability [9]. While the problem is undecidable in general and NP-complete under certain assumptions [18], a static analysis that gives an approximate answer is useful as a basis for tools such as data race detectors [6]. Researchers have defined may-happen-in-parallel analysis for Ada [7, 13, 15, 16], Java [12, 3], X10 [2], and other languages. Those seven papers specify polynomial-time analyses using pseudo-code, data flow equations or set constraints, but they give no proofs of correctness with respect to a formal semantics. Additionally, the algorithms are either intraprocedural, rely on inlining of method calls before the analysis begins, or treat call sites in a context-insensitive fashion, that is, merge the information from different call sites.

We believe that when a program happen may execute two statements in parallel, it should be because the programmer intended it. Thus, may-happen-in-parallel information should be something the programmer has in mind while programming, rather than something discovered after the programming is done. The data flow equations and set constraints used in previous work are great for specifying what an analysis does, but are much less helpful for a working programmer. We will use a type system to specify a may-happen-in-parallel analysis that comes with all the advantages of type systems: syntax-directed type rules and a well-understood approach to proving correctness [20]. In our case, we also get a straightforward way to do modular, context-sensitive analysis of methods, that is, a way to analyze each method just once and avoid merging information from different call sites for the same method. The advantage of syntax-directed type rules is that each rule concentrates on just one form of statement, and explains using only local information why the may-happen-in-parallel information for that statement is the way it is.

The paper by Agarwal et al. [2] on an intraprocedural may-happen-in-parallel analysis for X10 first determines what cannot happen in parallel and then takes its complement. In contrast, our type system defines a modular, interprocedural may-happen-in-parallel analysis without use of double negation. Additionally, our analysis comes with a proof of correctness plus experiments.

Naik and Aiken [14] presented a flow- and context-sensitive may-happen-in-parallel analysis for Java as part of a static race detector. Their problem differs from ours because Java has no construct like finish.

Previous approaches to interprocedural analysis of concurrent programs include the paper by Barik and Sarkar [4] on X10, and the paper by von Praun and Gross [19] on Java; both present analyses that differ from may-happen-in-parallel analysis. The paper by Barik and Sarkar mentions that a refinement of their analysis with may-happen-in-parallel information is left for future work.

For a program $p$, let $\operatorname{MHP}(p)$ be the true may-happen-inparallel information. Intuitively, if an execution of $p$ can reach a state in which two statements with labels $l_{1}$ and $l_{2}$ can both happen next, then $\left(l_{1}, l_{2}\right) \in \mathrm{MHP}(p)$, and only such pairs are members of $\operatorname{MHP}(p)$. We will show how to compute a conservative yet precise approximation of $\operatorname{MHP}(p)$. In our case, a conservative approximation is a superset of $\operatorname{MHP}(p)$.

Our approach is to assign a type $E$ to a program; every program has a type. Intuitively, $E$ is a method summary for each method in the program. Each summary is a pair $(M, O)$, where $M$ is may-happen-in-parallel information and $O$ is a helper set that we explain in a later section. Our correctness theorem (Theorem 3) says that if $p$ has type $E$, and $E\left(f_{0}\right)=(M, O)$, where $f_{0}$ is the name of the main method, then

$$
\operatorname{MHP}(p) \subseteq M
$$

In other words, $M$ is a conservative approximation of $\operatorname{MHP}(p)$.
If $E$ is given, then we can do type checking. In practice, we want to compute $E$ from $p$, that is, we want to do type inference, without any annotations or other help at all. For type inference we use the following approach. From $p$ we generate a family of set constraints $C(p)$, and then we solve $C(p)$ using a polynomial-time algorithm that resembles the algorithms used for iterative data flow analysis. We prove the equivalence result (Theorem 4) that the solutions to $C(p)$ coincides with the types of $p$.

The slogan of the overall approach could be: the type system leads to syntax-directed type rules and a proof of correctness, the constraints lead to a polynomial time algorithm, and the type system and the constraints are equivalent. Our use of types gives a high-level specification of the analysis, while the use of constraints for us is an implementation technique.

In the following section we give two examples of skeletons of programs in our core language, along with discussions of how our analysis works. In Section 3 we present our core calculus, in Section 4 we show our type system, and in Section 5 we show how to generate and solve constraints. Finally, in Section 6 we discuss our experimental results for 13,000 lines of X10 code, and in Section 7 we conclude. Three appendices give detailed proofs of our theorems.

## 2. Examples

In this section we will give a taste of how our may-happen-inparallel analysis works, and what results it can produce.

Let us first outline the main challenges for may-happen-inparallel analysis for async-finish parallelism. The key problems stem from async, finish, loops and method calls. An async statement allows the body to run in parallel with any statement that follows it. If the body of a finish statement executes an async (or a method call that executes an async), then only when the async completes execution will the finish statement itself complete execution. This means that any statement in the body of a finish statement cannot run in parallel with anything that happens after the finish statement. A loop requires determining which async statements may occur in the body and recognizing that the body of the loop may run in parallel with those statements. Any bodies of async
statements that are executing at the time of a method call may run in parallel with anything that may be executed in the method body.

### 2.1 First Example: Intraprocedural Analysis

The first example is from a PPoPP 2007 paper by Agarwal et al. [2, Figure 4], with some minor changes.

```
void main() {
    S0: finish {
            S1: async {
                S13: finish {
                            S5: ...
                                    S6: async S11
                                    S7: async S12
                    }
                S8: ...
                }
            S2: ...
        }
    S3: ..
}
```

From this program, we generate set constraints. Each set constraint is an equality of a set variable and a set expression, where the set expression may use set union. In a later section, we will show the constraints in detail (Figure 5), and explain how we generate and solve them.

The output from our constraint solver says correctly that S2 may happen in parallel with each of $\mathrm{S} 5, \mathrm{~S} 6, \mathrm{~S} 7, \mathrm{~S} 8, \mathrm{~S} 11$, and S 12 , as well as with the entire finish statement. This is correct because the async statement S 1 has the statement S 2 occurring after it, so the entire body of the async may happen in parallel with S2.

The output also says that S11 and S12 may happen in parallel. This is correct because the two asyncs are not enclosed in separate finish statements and thus may be executing until the end of the enclosing finish. Furthermore, the output says that S7 and S11 may happen in parallel. This is correct because the body of an async may run in parallel with any statement that occurs after it.

The type inference algorithm found correctly that no other statements may happen in parallel. In particular, the inner finish statement ensures that S11 and S12 cannot run in parallel with the statements that follow the inner finish statement.

We conclude that for this program our algorithm determines the best possible may-happen-in-parallel information.

### 2.2 Second Example: Modular Interprocedural Analysis

The second example illustrates the modularity and context-sensitive aspects of our analysis.

```
void f() { async S5 }
void main() {
    S1: finish {
            async S3
            f()
        }
    S2: finish {
            f()
            async S4
        }
}
```

The output from our constraint solver says that S5 may happen in parallel with each of $S 3$, async $S 4$, and $S 4$, and that $S 3$ may also happen in parallel with the first call $f()$ and with async $S 5$. This is correct because the body of an async may run in parallel with any
statement that occurs after it, including after method boundaries. Here, S3 will run in parallel with the call $f()$, which in turn will execute an async with body S5. So, S3 may happen in parallel with $f()$, async $S 5$, and $S 5$. In the second finish, we have $f()$ executing first which will allow S 5 to run in parallel with async S 4 and S4.

The type inference algorithm found correctly that no other statements may happen in parallel. In particular, S1 and S2 are finish statements that prevent the body of S1 to run in parallel with the body of S2, and our algorithm determines that S3 cannot happen in parallel with S4.

We conclude that also for this program our algorithm determines the best possible may-happen-in-parallel information.

Let us contrast the results from our analysis (Section 4) with the results from a context-insensitive analysis (Section 7) that merges information from different call sites. The context-insensitive analysis would say that S3 may happen in parallel with S4. The reason is that the context-insensitive analysis will conservatively merge (i) the information from the first call site that S3 may be executing when method $f$ completes its execution with (ii) the information from the second call site that S 4 runs after the call completes execution. The pair of S3 and S4 is an example of a false positive: the context-insensitive analysis infers that they may happen in parallel when in fact they cannot happen in parallel. In contrast, our analysis doesn't produce this particular false positive.

## 3. Featherweight X10

### 3.1 Design

FX10 is a core calculus in which sequential computation is the default, parallelism comes from the async statement, and synchronization comes from the finish statement.

A subset of X10. The language X10, version 1.5 , is the starting point for the design of FX10. From X10 we take:

- a Turing-complete core consisting of while-loops, assignments, and a single one-dimensional integer array,
- methods and method calls, and
- the async and finish statements.

Both programs in Section 2 are FX10 programs, if we fill in the missing statements and ignore the labels of statements. We omit many features from X10, including places, distributions, and clocks.

Conventions and omitted boilerplate syntax. The grammar for FX10 uses skip in place of the empty statement ";", and it specifies abstract syntax so it omits " $\{$ " and "\}" for grouping of statements. The grammar for FX10 also omits some boilerplate syntax that is required to change an FX10 program into an executable X10 program. The boilerplate syntax consists of a main class plus one other class with a final field a that contains a one-dimensional integer array, a constructor, and then the methods from the FX10 program. For example, after we add the boilerplate syntax to the program in Section 2.2, it reads:

```
public class Main {
    public static void main(String[] args) {
        new C().main();
    }
}
class C {
    final int[:rank==1] a;
    public C() { ... }
    void f() { /* unchanged */ }
    void main() { /* unchanged */ }
}
```

The the constructor C() initializes the array variable a ; for example, it might load the array's contents from a file.

One array. An FX10 computation works with a single shared memory given by an integer array variable named a. We chose to work with an array variable instead of a family of integer variables because of a subtlety in the X10 semantics of async. The body of an async statement can access variables outside the async statement only if those variables are declared final, that is, they can be initialized once but not updated later. We want to enable updates to variables, and therefore final integer variables are insufficient for our purposes. Instead we have a final integer array variable to which an array reference is assigned once, while the individual locations of the array can be updated and read multiple times.

Methods. FX10 contains methods and method calls to enable us to show our context-sensitive may-happen-in-parallel analysis. For studies in which methods play no particular role, researchers can easily remove methods from the language.

A method in FX10 has no arguments, no local variables, no return value, and no mechanism for early return. The reason is that the key problem for may-happen-in-parallel analysis stems from procedure calls themselves. A static analysis may be context insensitive (that is, merge the information from different call sites), or context sensitive (that is, separate the information from different call sites). As we will show in Section 7, for the case of may-happen-in-parallel analysis, the difference is significant.

Informal semantics. The semantics of FX10 uses the binary operator $\|$ in the semantics of async, it uses the binary operator $\triangleright$ in the semantics of finish, and it uses the constant $\sqrt{ }$ to model a completed computation. A state in the semantics is a triple consisting of the program, the state of the array a, and a tree $T$ that describes the code executing. The internal nodes of $T$ are either $\|$ or $\triangleright$, while the leaves are either $\sqrt{ }$ or $\langle s\rangle$, where $s$ is a statement.

As an example of how the semantics works, we will now informally discuss an execution of the program in Section 2.2. Let us focus on the code that is being executed and let us ignore the state of the array a. The execution begins in main by executing the first finish statement.

$$
\begin{aligned}
\langle\text { finish }\{\text { async } \mathrm{S} 3 \mathrm{f}()\} & \mathrm{S} 2\rangle \\
\langle\text { async } \mathrm{S} 3 \mathrm{f}()\rangle & \triangleright \\
(\langle\mathrm{S} 3\rangle \|\langle\mathrm{f}(\mathrm{)}\rangle) & \rightarrow \\
(\langle\mathrm{S} 3\rangle \|\langle\mathrm{S} 2\rangle & \rightarrow \\
(\langle\mathrm{S} 3\rangle \|\langle\mathrm{S} 5\rangle) & \triangleright
\end{aligned}
$$

The first step illustrates the semantics of finish and introduces $\triangleright$ to signal that the left-hand side of $\triangleright$ must complete execution before the right-hand can proceed. The second step illustrates the semantics of async and introduces $\|$ to signal that S3 and $f()$ should proceed in parallel. The third step illustrates the semantics of method call and replaces the call $f()$ with the body async S5. The fourth step again illustrates the semantics of async. The two sides of $\|$ can execute in parallel, which we model with an interleaving semantics. When one of the sides completes execution, it will reach the state $\sqrt{ }$. For example if $\mathrm{S} 3 \rightarrow \sqrt{ }$, then the semantics can do $(\mathrm{S} 3 \| \mathrm{S} 5) \rightarrow(\sqrt{ } \| \mathrm{S} 5) \rightarrow \mathrm{S} 5$. When also S5 completes execution, the semantics can finally proceed with the right-hand side of $\triangleright$.

### 3.2 Syntax

We use $c$ to range over natural numbers $\mathbb{N}=\{0,1,2, \ldots\}$, and we use $l$ to range over labels. Figure 1 shows the grammar for the abstract syntax of FX10.

An FX10 program consists of a family of methods $f_{i}$, each with no arguments, return type void, and body $s_{i}$. We use $p\left(f_{i}\right)$ to denote $s_{i}$. Each $s_{i}$ can access a nonempty one-dimensional array $a$ with indices $0 . . n-1$, where $n>0$. We use $d$ to range over natural

Figure 1. The grammar of Featherweight X10.
numbers up to $n-1$ : $\{0,1,2, \ldots, n-1\}$. When execution of the program begins, input values are loaded into all elements of the array $a$, and if the execution terminates, the result is in $a[0]$. Thus, the array $a$ is fully initialized for all indices $d$ when computation begins.

The body of each method is a statement. A statement is a sequence of labeled instructions. The labels have no impact on computation but are convenient for our may-happen-in-parallel analysis. Each instruction is either skip, assignment, while loop, async, finish, or method call.

The right-hand side of an assignment is an expression that can be either an integer constant or an array lookup plus one. An async statement async ${ }^{l} s$ runs $s$ in parallel with the continuation of the async statement. The async statement is a lightweight notation for spawning threads, while a finish statement finish ${ }^{l} s$ waits for termination of all async bodies started while executing $s$.

It is straightforward to show that FX10 is Turing-complete, via a reduction from the while-programs of Kfoury et al. [10].

Compared to the core language for async-parallelism of Abadi and Plotkin [1], FX10 differs by having a finish statement and methods, while their language has constructs of yield and block.

### 3.3 Semantics

Our semantics of FX10 is inspired by the semantics for a larger subset of X10 given by Saraswat and Jagadeesan [17]. In FX10, all code runs on the same place.

We will now define a small-step operational semantics for FX10. In the semantics of while loops and method calls, we will use the following operator on statements. Let $s_{1} . s_{2}$ be defined as follows:

$$
\begin{aligned}
\text { skip }^{l} \cdot s_{2} & \equiv \text { skip }^{l} s_{2} \\
\left(i s_{1}\right) \cdot s_{2} & \equiv i\left(s_{1} \cdot s_{2}\right)
\end{aligned}
$$

Our semantic structures are arrays, trees, and states:

```
\(A \in\) Array \(=\mathbb{N} \rightarrow \mathbb{Z}\)
    Tree: \(T::=T \triangleright T \quad T \| T \quad|\quad\langle s\rangle| \sqrt{ }\)
        State \(=\) Program \(\times\) Array \(\times\) Tree
```

We use $A$ to denote the state of the array $a$, that is, a total mapping from natural numbers $(\mathbb{N})$ to integers $(\mathbb{Z})$. The initial state of $a$ is called $A_{0}$. If $c$ is a natural number, then $A(c)$ denotes the corresponding integer. We also define $A$ on expressions: $A(c)=c$ and $A(a[d]+1)=A(c)+1$.

A tree $T_{1} \triangleright T_{2}$ is convenient for giving the semantics of finish: $T_{1}$ must complete execution before we move on to executing $T_{2}$. A tree $T_{1} \| T_{2}$ represents a parallel execution of $T_{1}$ and $T_{2}$ that interleaves the execution of subtrees, except when disallowed by $\triangleright$. A tree $\langle s\rangle$ represents statement $s$ running. A tree $\sqrt{ }$ has completed execution.

A state in the semantics is a triple $(p, A, T)$. We will define the semantics via a binary relation on states, written $(p, A, T) \rightarrow$ $\left(p, A^{\prime}, T^{\prime}\right)$. The initial state of an execution of $p$ is $\left(p, A_{0},\left\langle s_{0}\right\rangle\right)$ where $s_{0}$ is the body of $f_{0}$, and $f_{0}$ is the name of the main method. Now we show the rules for taking a step from $(p, A, T)$. Rules (1)(6) below cover the cases where $T$ is either of the form $\left(T_{1} \triangleright T_{2}\right)$ or of the form $\left(T_{1} \| T_{2}\right)$, while Figure 2 shows the rules where $T$ is of the form $\langle s\rangle$. There is no rule for the case of $(p, A, \sqrt{ })$.

$$
\begin{gather*}
\left(p, A, \sqrt{ } \triangleright T_{2}\right) \rightarrow\left(p, A, T_{2}\right)  \tag{1}\\
\frac{\left(p, A, T_{1}\right)}{\left(p, A, T_{1} \triangleright T_{2}\right)} \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)  \tag{2}\\
\left(p, A, A^{\prime}, T_{1}^{\prime} \triangleright T_{2}\right)  \tag{3}\\
\left(p, A, T_{1} \| \sqrt{ }\right) \rightarrow\left(p, A, T_{2}\right)  \tag{4}\\
\frac{\left(p, A, T_{1}\right)}{\left(p, A, T_{1} \| T_{2}\right)} \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)  \tag{5}\\
\frac{\left(p, A, A^{\prime}, T_{1}^{\prime} \| T_{2}\right)}{\left(p, A, T_{1} \| T_{2}\right)} \rightarrow\left(p, A^{\prime}, T_{2}^{\prime}\right)  \tag{6}\\
\left(p, A^{\prime}, T_{1} \| T_{2}^{\prime}\right)
\end{gather*}
$$

We can now state the deadlock-freedom theorem of Saraswat and Jagadeesan. Let $\rightarrow^{*}$ be the reflexive, transitive closure of $\rightarrow$.

THEOREM 1. (Deadlock freedom) For every state $(p, A, T)$, either $T=\sqrt{ }$ or there exists $A^{\prime}, T^{\prime}$ such that $(p, A, T) \rightarrow\left(p, A^{\prime}, T^{\prime}\right)$.

Proof. See Appendix A.

## 4. May-Happen-in-Parallel Analysis

We use a type system to specify our modular, context-sensitive may-happen-in-parallel analysis. Every program has a type (Theorem 6) in our type system, which means that we can derive may-happen-in-parallel information for all programs. We first define three abstract domains and nine helper functions, and then proceed to show our type rules.

### 4.1 Abstract Domains and Helper Functions

We use $\mathcal{P}(S)$ to denote the powerset of a set $S$.
We define LabelSet $=\mathcal{P}($ Label $)$. We use $A, B, O, R$ to range over LabelSet.

We define LabelPairSet $=\mathcal{P}($ Label $\times$ Label $)$. We use $M$ to range over LabelPairSet.

We define TypeEnv $=$ MethodName $\rightarrow($ LabelPairSet $\times$ LabelSet). We use $E$ to range over TypeEnv; we will call each $E$ a type environment.

Intuitively, we will use LabelSet for collecting sets of labels of statements; we will use LabelPairSet for collecting labels of pairs of statements that may happen in parallel; and we will use TypeEnv to map methods to statements that may happen in parallel and to statements that may still be executing when the method completes execution.

We define nine functions on the data sets Tree, Statement, Label, LabelSet, and LabelPairSet, see Figure 3.

The function call $\operatorname{Slabels}_{p}(s)$ conservatively approximates the set of labels of statements that may be executed during the execution of the statement $s$ in program $p$. The function call Tlabel $_{p}(T)$ conservatively approximates the set of labels of statements that may be executed during the execution of the tree $T$ in program $p$. Notice that Tlabels is defined in terms of Slabels. The function call $F$ Slabels $(s)$ returns the singleton set consisting of the label of $s$.

$$
\begin{align*}
\left(p, A,\left\langle\text { skip }^{l}\right\rangle\right) & \rightarrow(p, A, \sqrt{ })  \tag{7}\\
\left(p, A,\left\langle\text { skip }^{l} k\right\rangle\right) & \rightarrow(p, A,\langle k\rangle)  \tag{8}\\
\left(p, A,\left\langle a[d]=^{l} e ; k\right\rangle\right) & \rightarrow(p, A[c:=A(e)],\langle k\rangle)  \tag{9}\\
\left(p, A,\left\langle\left(\text { while }^{l}(a[d] \neq 0) s\right) k\right\rangle\right) & \rightarrow(p, A,\langle k\rangle) \quad(\text { if } A(c)=0)  \tag{10}\\
\left(p, A,\left\langle\left(\text { while }^{l}(a[d] \neq 0) s\right) k\right\rangle\right) & \rightarrow\left(p, A,\left\langle s \cdot\left(\text { while }^{l}(a[d] \neq 0) s\right) k\right\rangle\right) \quad(\text { if } A(c) \neq 0)  \tag{11}\\
\left(p, A,\left\langle\left(\text { async }^{l} s\right) k\right\rangle\right) & \rightarrow(p, A,\langle s\rangle \|\langle k\rangle)  \tag{12}\\
\left(p, A,\left\langle\left(\text { finish }^{l} s\right) k\right\rangle\right) & \rightarrow(p, A,\langle s\rangle \triangleright\langle k\rangle)  \tag{13}\\
\left(p, A,\left\langle f_{i}()^{l} k\right\rangle\right) & \rightarrow\left(p, A,\left\langle s_{i} \cdot k\right\rangle\right) \quad\left(\text { where } p\left(f_{i}\right)=s_{i}\right) \tag{14}
\end{align*}
$$

Figure 2. Operational semantics rules for $(p, A, T)$ where $T$ is of the form $s$.

The function call FTlabels $(T)$ conservatively approximates the set of labels of statements that can be executed next in the tree $T$. Notice that FTlabels is defined in terms of FSlabels. The function call symeross $(A, B)$ returns the union of the crossproduct of $A$ and $B$ with the crossproduct of $B$ and $A$. We need symcross to help produce a symmetric set of pairs of labels. The functions Lcross, Scross, and Tcross are convenient abbreviations of calls to symcross. The function call parallel $(T)$ specifies for the tree $T$ a set of pairs of labels of statements that are "executing in parallel right now", that is, for each pair, both can take a step now. Notice that parallel is defined in terms of symcross and FTlabels. The function parallel is central to our definition of correctness: for every reachable tree $T$, we must conservatively approximate parallel $(T)$.

### 4.2 Type Rules

We will use type judgments of three forms:

$$
\begin{array}{rll} 
& \vdash & p: E \\
p, E, R & \vdash & T: M \\
p, E, R & \vdash & s: M, O
\end{array}
$$

The first form of judgment says that program $p$ is well typed and that the methods in $p$ have the types given by $E$. The second form of judgment says that tree $T$ is well typed in a situation where $R$ is a set of labels of statements that may run in parallel with $T$ when $T$ starts execution, and $M$ is a set of pairs of labels such that for each pair $\left(l_{1}, l_{2}\right)$, the instructions with labels $l_{1}$ and $l_{2}$ may happen in parallel during the execution of $T$. We will call $M$ the may-happen-in-parallel set. The third form of judgment says that statement $s$ is well typed in a situation much like the previous one, now with the addition that $O$ is the set of labels of instructions that may be executing when the execution of $s$ terminates. For $p, E, R \vdash s: M, O$, we will always have $R \subseteq O$; in other words, $O$ can contain labels of both statements that started before $s$ and statements that started during the execution of $s$. A type environment $E$ that maps a method name $f_{i}$ to a pair $\left(M_{i}, O_{i}\right)$ represents that during a call to $f_{i}$, the pairs in $M_{i}$ may happen in parallel, and the statements with labels in $O_{i}$ may be executing when the call to $f_{i}$ returns.

Figure 4 shows the type rules.
Rule (45) says that a program is well typed with a type environment $E$ if each method body has the type specified by $E$ in a situation where $R=\emptyset$. This rule enables modular type checking: we only need to type check each method once, even though method calls may be made in situations where $R \neq \emptyset$.

Rule (46) says three things. First, the set of labels $R$ of statements that may run in parallel with $T_{1} \triangleright T_{2}$ when $T_{1} \triangleright T_{2}$ starts execution, are also the set of labels of statements that may run in
parallel with $T_{1}$ and with $T_{2}$ when each of them starts execution. Second, we get the may-happen-in-parallel set for $T_{1} \triangleright T_{2}$ by taking the union of the may-happen-in-parallel set for $T_{1}$ and the may-happen-in-parallel set for $T_{2}$. Third, there is no interaction between $T_{1}$ and $T_{2}$ that produces new pairs of labels of statements that may happen in parallel. This rule has a close cousin in Rule (55) for finish statements.

Rule (47) says that for a tree $T_{1} \| T_{2}$, the analysis of $T_{1}$ must take into account that $T_{2}$ may already be executing, and vice versa. We do that by extending $R$ with labels from the appropriate subtree, for example Tlabels $\left(T_{2}\right)$. This rule has a close cousin in Rule (54) for async statements.

Rule (48) says that we can type check a tree $\langle s\rangle$ by typing the statement $s$.

Rule (49) says that if a subtree has completed execution, then nothing runs in parallel with it.

Rule (50) says that the skip instruction runs in parallel with the statements with labels in $R$. The $\operatorname{Lcross}()$ function represents every possible pairing of the labels in $R$ with skip's label. Since skip does not generate statements that may run in parallel after the execution of the skip, we see that the set of labels of instructions that may be executing when skip terminates is $R$.

Rule (51) works similarly to the previous rule, with the exception that we are additionally dealing with a substatement after the skip statement. We see that the skip label may run in parallel with the $R$ labels, which is represented via the use of $\operatorname{Lcross}()$. We now type the substatement $s_{1}$ where we retain the same $R$ for the environment because skip doesn't generate anything that can run in parallel. The resulting $O$ labels from the $s_{1}$ judgement will be the $O$ labels returned from the judgement for skip; $s_{1}$. The may-happen-in-parallel set is the union of the set produced by $\operatorname{Lcross}()$ that we have seen above and the $M$ from the $s_{1}$ judgement.

Rule (52) is similar to Rule (51).
Rule (53) is based on a conservative assumption: the loop body will be executed at least twice. Two iterations are sufficient to model situations in which the loop body may happen in parallel with itself. The rule relies on the assumption when it includes $\operatorname{Lcross}\left(l, O_{1}\right)$ and $\operatorname{Scross}_{p}\left(s_{1}, O_{1}\right)$ in the may-happen-inparallel set. The rule also shows how we use the set $O_{1}$ when typing a sequence of statements, which here is a sequence of a while loop and $s_{2}$ : we use the set $O_{1}$ as the set of labels of statements executing at the beginning of execution of $s_{2}$.

Rule (54) says that for a statement async ${ }^{l} s_{1} s_{2}$ the analysis of $s_{1}$ must take into account that $s_{2}$ may already be executing, and vice versa. We do that by extending $R$ with labels from the appropriate statement, for example Slabels $\left(s_{2}\right)$. By adding the entire Slabels $\left(s_{2}\right)$ we make the conservative assumption that the entire async body may run in parallel with the continuation, and vice versa. Notice that the label set $O_{1}$ appears once in the first

Slabels: Program $\rightarrow$ (Statement $\rightarrow$ LabelSet $)$
Slabel $_{p}$ is the $\subseteq$-least solution to the following equations.

$$
\begin{align*}
\text { Slabels }_{p}\left(\text { skip }^{l}\right) & =\{l\}  \tag{15}\\
\text { Slabels }_{p}\left(\text { skip }^{l} k\right) & =\{l\} \cup \text { Slabels }_{p}(k)  \tag{16}\\
\text { Slabels }_{p}\left(a[d]=^{l} e ; k\right) & =\{l\} \cup \text { Slabels }_{p}(k)  \tag{17}\\
\text { Slabels }_{p}\left(\text { while }_{l}(a[d] \neq 0) s k\right) & =\{l\} \cup \text { Slabels }_{p}(s) \cup \text { Slabels }_{p}(k)  \tag{18}\\
\text { Slabels }_{p}\left(\text { async }^{l} s k\right) & =\{l\} \cup \text { Slabels }_{p}(s) \cup \text { Slabels }_{p}(k)  \tag{19}\\
\text { Slabels }_{p}\left(\text { finish }^{l} s k\right) & =\{l\} \cup \text { Slabels }_{p}(s) \cup \text { Slabels }_{p}(k)  \tag{20}\\
\text { Slabels }_{p}\left(f_{i}()^{l} k\right) & =\{l\} \cup \text { Slabels }_{p}\left(s_{i}\right) \cup \text { Slabels }_{p}(k) \text { if } p\left(f_{i}\right)=s_{i} \tag{21}
\end{align*}
$$

& M_{i} \cup M^{\prime} \text {, } \\
& O^{\prime}
\end{aligned}
$$

Figure 4. Type rules.
hypothesis and never again; let us explain why this seemingly strange phenomenon makes sense. In any typing judgement such as $p, E, R \vdash s_{1}: M_{1}, O_{1}$, we have that $O_{1}$ is a union of $R$ and some $O^{\prime}$ (this is a lemma in our proof of correctness). The set $O^{\prime}$ must be a subset of $\operatorname{Slabels}_{p}\left(s_{1}\right)$ as the async statement is the only time where new labels are introduced into $O$. So, in the typing of $s_{2}$, the set Slabel $_{p}\left(s_{1}\right)$ contains $O^{\prime}$.

Rule (55) says that the set $O_{1}$ produced by the typing of the finish body can be ignored. So, we use the initial $R$ for typing both the finish body $s_{1}$ and the continuation $s_{2}$, and thereby indicate that we are disregarding whatever statements that may be running as a result of executing $s_{1}$. In other words, we don't use $O_{1}$ in the typing of $s_{2}$. As a result, if any labels occur in $O_{1}$ that are not in $R$, the rule reflects that the corresponding statements will not happen in parallel with $s_{2}$. The statements with labels in $R$ that were executing when $s_{1}$ started execution may still be executing
when $s_{2}$ starts execution so we use $R$ in the typing of $s_{2}$ to account for that.

Rule (56) shows how to type check a call with an arbitrary $R$ even though Rule (45) has only provided a type environment in which methods have been type checked with $R=\emptyset$. The type environment says that for $R=\emptyset$, the set $O_{i}$ contains the labels of statements that may be executing at the end of the call. We then simply take the union of $R$ and $O_{i}$ and use that for typing the continuation $k$. The may-happen-in-parallel set for the method call contains symeross $\left(\operatorname{Slabel}_{p}\left(p\left(f_{i}\right)\right), R\right)$, a set that reflects that anything that may happen in parallel with call may also happen in parallel with the body.

The following soundness theorem says that for a program $p$ and any tree $T$ reachable by executing $p$, the set $\operatorname{parallel}(T)$ is a subset of the the may-happen-in-parallel set determined by type checking $p$. Intuitively, the type system conservatively approximates all parallel $(T)$.

THEOREM 2. (Soundness) $I f \vdash p: E$ and $p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{*}(p, A, T)$ then parallel $(T) \subseteq M$.

Proof. See Appendix B.
For a program $p$, define
$\operatorname{MHP}(p)=\bigcup\left\{\operatorname{parallel}(T) \mid\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{*}(p, A, T)\right\}$
THEOREM 3. (Correctness) If $\vdash p: E$ and $E\left(f_{0}\right)=(M, O)$, then $\mathrm{MHP}(p) \subseteq M$.

Proof. Immediate from Theorem 2.

## 5. Type Inference

The type inference problem is: given a program $p$, find $E$ such that $\vdash p: E$. We will do type inference in two steps: first we rephrase the type inference problem as an equivalent constraint problem, and then we solve the constraint problem.

### 5.1 Constraints

Variables. For every statement $s$ we will generate three set variables: $r_{s}, o_{s}$, and $m_{s}$. The variables $r_{s}$ and $o_{s}$ will range over sets of labels, while the variable $m_{s}$ will range over sets of pairs of labels. For every method $f_{i}$ we will generate two set variables: $o_{i}$ and $m_{i}$.

Kinds of constraints. We will use two kinds of constraints. The level- 1 constraints are of the forms:

$$
\begin{aligned}
v & =v^{\prime} \\
v & =c \\
v & =c \cup v^{\prime}
\end{aligned}
$$

where $v$ is an $r$ variable or an $o$ variable, $v^{\prime}$ is an $r$ variable or an $o$ variable, and $c$ is a set constant. The level- 2 constraints are of the forms:

```
\(v=v^{\prime \prime}\)
\(v=\operatorname{Lcross}\left(l, v^{\prime}\right)\)
\(v=\operatorname{Lcross}\left(l, v^{\prime}\right) \cup v^{\prime \prime}\)
\(v=\operatorname{Lcross}\left(l, v^{\prime}\right) \cup v^{\prime \prime} \cup v^{\prime \prime \prime}\)
\(v=\operatorname{Lcross}\left(l, v^{\prime}\right) \cup \operatorname{Scross}\left(c, v^{\prime}\right) \cup v^{\prime \prime} \cup v^{\prime \prime \prime}\)
\(v=\operatorname{Lcross}\left(l, v^{\prime}\right) \cup \operatorname{symcross}\left(c, v^{\prime}\right) \cup v^{\prime \prime} \cup v^{\prime \prime \prime}\)
```

where $v$ is an $m$ variable, $v^{\prime}$ is an $r$ variable or an $o$ variable, $v^{\prime \prime}$ and $v^{\prime \prime \prime}$ are $m$ variables, $l$ is the label associated with a statement, and $c$ is a set constant.

$$
\begin{aligned}
& r_{S 0}=\{ \} \\
& r_{S 1}=r_{S 0} \\
& r_{S 13}=\{S 2\} \cup r_{S 1} \\
& r_{S 5}=r_{S 13} \\
& r_{S 6}=r_{S 5} \\
& r_{S 11}=\{S 7, S 12\} \cup r_{S 6} \\
& o_{S 11}=r_{S 11} \\
& r_{S 7}=\{S 11\} \cup r_{S 6} \\
& r_{S 12}=r_{S 7} \\
& o_{S 12}=r_{S 12} \\
& o_{S 7}=\{S 12\} \cup r_{S 7} \\
& o_{S 6}=o_{S 7} \\
& o_{S 5}=o_{S 6} \\
& r_{S 8}=r_{S 13} \\
& o_{S 8}=r_{S 8} \\
& o_{S 13}=o_{S 8} \\
& r_{S 2}=\{S 5, S 6, S 7, S 8, S 11, S 12, S 13\} \cup r_{S 1} \\
& o_{S 2}=r_{S 2} \\
& o_{S 1}=o_{S 2} \\
& r_{S 3}=r_{S 0} \\
& o_{S 3}=r_{S 3} \\
& o_{S 0}=o_{S 3} \\
& m_{S 1}=\operatorname{Lcross}\left(S 1, r_{S 1}\right) \cup m_{S 13} \cup m_{S 2} \\
& m_{S 6}=\operatorname{Lcross}\left(S 6, r_{S 6}\right) \cup m_{S 11} \cup m_{S 7} \\
& m_{S 11}=\operatorname{Lcross}\left(S 11, r_{S 11}\right) \\
& m_{S 7}=\operatorname{Lcross}\left(S 7, r_{S 7}\right) \cup m_{S 12} \\
& m_{S 12}=\operatorname{Lcross}\left(S 12, r_{S 12}\right) \\
& m_{S 5}=\operatorname{Lcross}\left(S 5, r_{S 5}\right) \cup m_{S 6} \\
& m_{S 8}=\operatorname{Lcross}\left(S 8, r_{S 8}\right) \\
& m_{S 13}=\operatorname{Lcross}\left(S 13, r_{S 13}\right) \cup m_{S 5} \cup m_{S 8} \\
& m_{S 2}=\operatorname{Lcross}\left(S 2, r_{S 2}\right) \\
& m_{S 3}=\operatorname{Lcross}\left(S 3, r_{S 3}\right) \\
& m_{S 0}=\operatorname{Lcross}\left(S 0, r_{S 0}\right) \cup m_{S 1} \cup m_{S 3}
\end{aligned}
$$

Figure 5. Constraints for the example program in Section 2.1.

Valuations. For a given system of constraints $\mathcal{C}$, let $L$ be the set of labels that occur in $\mathcal{C}$. Let $\mathcal{D}$ denote the domain of valuations of the set variables: each function in $\mathcal{D}$ maps each $r$ and $o$ variable that occurs in $\mathcal{C}$ to a subset of $L$, it maps each $m$ variable that occurs in $\mathcal{C}$ to a subset of $L \times L$, and, for convenience, it maps each $o_{i}$ variable to a subset of $L$ and it maps each $m_{i}$ variable to a subset of $L \times L$, without regard to whether those $o_{i}$ and $m_{i}$ variables occur in $\mathcal{C}$. It is straightforward to show that $\mathcal{D}$ is a finite lattice.

Solutions. We say that $\varphi \in \mathcal{D}$ is a solution of the system of constraints if for every constraint $v=r h s$, we have $\varphi(v)=$ $\varphi(r h s)$. Here we use rhs to range over the possible right-hand sides of the constraints, and we use $\varphi(r h s)$ to denote $r h s$ with each variable $v^{\prime}$ occurring in $r h s$ replaced with $\varphi\left(v^{\prime}\right)$.

Constraint generation. We use $C(p)$ to denote the constraints generated from a program $p$, and we use $C(s)$ to denote the constraints generated a from statement $s$. We will define $C(p)$ and $C(s)$ below.

For each method $f_{i}$ in $p \equiv$ void $f_{i}()\left\{s_{i}\right\}, 1 . . u$, we define $C(p)=\bigcup_{i}\left(D_{i} \cup C\left(s_{i}\right)\right)$. We define $D_{i}$ to have the following constraints:

$$
\begin{align*}
r_{s_{i}} & =\emptyset  \tag{57}\\
o_{i} & =o_{s_{i}}  \tag{58}\\
m_{i} & =m_{s_{i}} \tag{59}
\end{align*}
$$

For $s \equiv s k i p^{l}$ we define $C(s)=D_{s}$ where $D_{s}$ is defined by the following constraints:

$$
\begin{align*}
o_{s} & =r_{s}  \tag{60}\\
m_{s} & =\operatorname{Lcoss}\left(l, r_{s}\right) \tag{61}
\end{align*}
$$

For $s \equiv \operatorname{skip}^{l} s_{1}$ we define $C(s)=D_{s} \cup C\left(s_{1}\right)$ where $D_{s}$ contains the following constraints:

$$
\begin{align*}
r_{s_{1}} & =r_{s}  \tag{62}\\
o_{s} & =o_{s_{1}}  \tag{63}\\
m_{s} & =\operatorname{Lcoss}\left(l, r_{s}\right) \cup m_{s_{1}} \tag{64}
\end{align*}
$$

For $s \equiv a[d]={ }^{l} e ; s_{1}$ we define $C(s)=D_{s} \cup C\left(s_{1}\right)$ where we define $D_{s}$ to have the constraints below:

$$
\begin{align*}
r_{s_{1}} & =r_{s}  \tag{65}\\
o_{s} & =o_{s_{1}}  \tag{66}\\
m_{s} & =\operatorname{Lcoss}\left(l, r_{s}\right) \cup m_{s_{1}} \tag{67}
\end{align*}
$$

For $s \equiv$ while $(a[d] \neq 0) s_{1} s_{2}$ we define $C(s)=D_{s} \cup$ $C\left(s_{1}\right) \cup C\left(s_{2}\right)$ where we define $D_{s}$ to have the following constraints:

$$
\begin{align*}
r_{s_{1}} & =r_{s}  \tag{68}\\
r_{s_{2}} & =o_{s_{1}}  \tag{69}\\
o_{s} & =o_{s_{2}}  \tag{70}\\
m_{s} & =\binom{\operatorname{Lcross}\left(l, o_{s_{1}}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, o_{s_{1}}\right) \cup}{m_{s_{1}} \cup m_{s_{2}}} \tag{71}
\end{align*}
$$

For $s \equiv a_{s y n c}{ }^{l} s_{1} s_{2}$ we define $C(s)=D_{s} \cup C\left(s_{1}\right) \cup C\left(s_{2}\right)$ and define $D_{s}$ to have the constraints:

$$
\begin{align*}
r_{s_{1}} & =\operatorname{Slabels}\left(s_{2}\right) \cup r_{s}  \tag{72}\\
r_{s_{2}} & =\operatorname{Slabels}\left(s_{1}\right) \cup r_{s}  \tag{73}\\
o_{s} & =o_{s_{2}}  \tag{74}\\
m_{s} & =\operatorname{Lcross}\left(l, r_{s}\right) \cup m_{s_{1}} \cup m_{s_{2}} \tag{75}
\end{align*}
$$

For $s \equiv$ finish $^{l} s_{1} s_{2}$ we have $C(s)=D_{s} \cup C\left(s_{1}\right) \cup C\left(s_{2}\right)$. We define $D_{s}$ to have the following constraints:

$$
\begin{align*}
r_{s_{1}} & =r_{s}  \tag{76}\\
r_{s_{2}} & =r_{s}  \tag{77}\\
o_{s} & =o_{s_{2}}  \tag{78}\\
m_{s} & =L \operatorname{cross}\left(l, r_{s}\right) \cup m_{s_{1}} \cup m_{s_{2}} \tag{79}
\end{align*}
$$

And finally for $s \equiv f_{i}()^{l} k$ we have $C(s)=D_{s} \cup C(k) . D_{s}$ is defined to have the following constraints:

$$
\begin{align*}
r_{k} & =r_{s} \cup o_{i}  \tag{80}\\
o_{s} & =o_{k}  \tag{81}\\
m_{s} & =\left(\begin{array}{l}
\operatorname{Lcross}\left(l, r_{s}\right) \cup \\
\operatorname{symcross}\left(\operatorname{Slabels}_{p}\left(p\left(f_{i}\right)\right), r_{s}\right) \cup \\
m_{i} \cup m_{k}
\end{array}\right) \tag{82}
\end{align*}
$$

Types and constraints are equivalent in the sense of Theorem 4 below. Intuitively, a program has a type if and only if the constraints are solvable. Additionally, we can map a type derivation to a solution to the constraint system, and vice versa. To state the theorem,
we need the following definition. For $\varphi \in \mathcal{D}$, we say that $\varphi$ extends $E$ if and only if $\forall f_{i} \in \operatorname{dom}(E):\left(\varphi\left(m_{i}\right), \varphi\left(o_{i}\right)\right)=E\left(f_{i}\right)$.

THEOREM 4. (Equivalence) $\vdash p: E$ if and only if there exists $a$ solution $\varphi$ of $C(p)$ where $\varphi$ extends $E$.

Proof. See Appendix C.
Theorems like Theorem 4 that relate types and constraints have been known since a paper by Kozen et al. [11].

### 5.2 Solving Constraints

We will now explain how to solve the constraints $C(p)$ generated from a program $p$. Our solution procedure resembles the algorithms used for iterative data flow analysis.

Notice that the constraints in $C(p)$ have distinct left-hand sides and that every variable is the left-hand side of some constraint. This enables us to define the function

$$
\begin{aligned}
& F \quad: \quad \mathcal{D} \rightarrow \mathcal{D} \\
& F \quad=\quad \lambda \varphi \in \mathcal{D} \cdot \lambda v \cdot \varphi(r h s)
\end{aligned}
$$

(where $v=r h s$ is a constraint)
It is straightforward to show that $F$ is monotone. So, $F$ is a monotone function from a finite lattice $\mathcal{D}$ to itself. The least-fixed-point theorem guarantees that $F$ has a least fixed point. Moreover, it is straightforward to see that the fixed points of $F$ coincide with the solutions of $C(p)$. Hence, the least fixed point of $F$ is the least solution of $C(p)$ and thus we have shown the following theorem.

## THEOREM 5. $C(p)$ has a least solution.

We solve the constraints $C(p)$ by executing the fixed-point computation that computes the least fixed point of $F$. The worstcase time complexity is $O\left(n^{6}\right)$ where $n$ is the size of the constraint system. Let us explain the reason for the $O\left(n^{6}\right)$ time complexity in detail. First, we have $O(n) m$ variables that each can contain $O\left(n^{2}\right)$ pairs, so we have $O\left(n^{3}\right)$ iterations. In each iteration we consider $O(n)$ constraints and for each one we must do a finite number of set unions. If we represent each set as a bit vector with $O\left(n^{2}\right)$ entries, then set union takes $O\left(n^{2}\right)$ time. The total is thus $O\left(n^{3}\right) \times O(n) \times O\left(n^{2}\right)=O\left(n^{6}\right)$.

The guaranteed existence of a least solution of $C(p)$ implies that $p$ has a type, as expressed in the following theorem.
THEOREM 6. There exists $E$ such that $\vdash p: E$.
Proof. Combine Theorem 4 and Theorem 5.

### 5.3 Implementation

One approach to implementing type inference would be to solve the constraints all at once. As an optimization of that, our implementation of type inference proceeds in three steps:

1. solve the equations that define Slabels,
2. solve the level- 1 constraints, and finally

3 . solve the level-2 constraints.
The level- 1 constraints don't involve $m$ variables so we can solve them without involving the level-2 constraints. Once we have a solution to the level- 1 constraints, we can simplify the level-2 constraints by replacing each $r$ variable and $o$ variable with its solved form. The simplified level-2 constraints are of the forms

$$
\begin{aligned}
v & =v^{\prime \prime} \\
v & =c \\
v & =c \cup v^{\prime \prime} \\
v & =c \cup v^{\prime \prime} \cup v^{\prime \prime \prime}
\end{aligned}
$$

where $v, v^{\prime \prime}, v^{\prime \prime \prime}$ are $m$ variables, and $c$ is a set constant.
The equations that define Slabels are in the form of simplified level-2 constraints and we solve them using the same iterative approach that we use for level-2 constraints.

The constraints for FX10 are all we need to type inference for the full X10 language; the remaining constructs generate constraints that are similar to those for FX10.

### 5.4 Example

From the program in Section 2.1, we generate the constraints listed in Figure 5. As explained in Section 2.1, the output from our constraint solver says correctly that S 2 may happen in parallel with each of S5, S6, S7, S8, S11, and S12, as well as with the entire finish statement, that S11 and S12 may happen in parallel, and that S7 and S11 may happen in parallel.

## 6. Experimental Results

We ran our experiments on a system that has dual Intel Xeon CPUs running at 3.06 GHz with 512 KB of cache and 4 GB of main memory.

We use 13 benchmarks taken from the HPC challenge benchmarks, the Java Grande benchmarks in X10, the NAS benchmarks, and two benchmarks written by ourselves. Figure 6 shows the number of lines of code (LOC), the number of asyncs and the number of constraints. The number of asyncs includes the number of foreach and ateach loops, which are X10 constructs that let all the loop iterations run in parallel. We can think of foreach and ateach as plain loops where the body is wrapped in an async. Our own plasma simulation benchmark, called plasma, is the longest and by far the most complicated benchmark with 151 asyncs.

Figure 6 shows a division of the asyncs into two categories: loop asyncs and place-switching asyncs. Loop asyncs are asyncs that occur in loops and are not wrapped in a finish; such asyncs may happen in parallel with asyncs from different iterations of the same loop. The vast majority of the loop asyncs occur in ateach and foreach loops. Place-switching asyncs are based on a more general form of async than what FX10 supports and are used to switch between places. Our implementation handles the more general form of async in exactly the same way as the asyncs in FX10. Most often such place-switching enables data transfers or remote computation. A common usage found in our benchmarks is creating a data value such that it may be usable across async boundaries and then storing that data in a buffer on the place where the data is needed. Note here that for an ateach loop, we count the implicit async as a loop async even though it also serves the purpose of place switching.

Our implementation of type inference for X10 first translates an X10 program to a condensed form that closely resembles FX10, and then it proceeds to generate and solve constraints. The condensed form has ten kinds of nodes, namely end, async, call, finish, if, loop, method, return, skip, and switch, see Figure 7. The total number of nodes is a good measure of the size of the input to our type inference algorithm. Switch nodes are unlike anything we have in FX10; we use them to accommodate various control-flow statements. End nodes do not correspond to any program point in the code, but act as place holders for our constraint system. Skip nodes are all the various statements and expressions that don't affect the analysis and represent blocks of code that don't contain any method calls, returns, asyncs or finishes.

Figure 6 lists the numbers of constraints, and Figure 8 lists the time to do type inference and the executed number of iterations. Method calls appear to add a significant amount of time to solve the constraints, most notably seen in the number of iterations required to solve the Slabels constraints. When an iteration for computing label sets completes, a call site will need to propagate any new labels to neighboring statements and eventually the enclosing

Figure 9. Experimental results: comparison of our context-sensitive analysis to a context-insensitive analysis.
method will need another iteration to disseminate new sets to its callers. This effect does not appear when solving the level-1 and level-2 constraints; we believe that finish statements help limit the propagation. Finish statements cap how far the sets can flow down a call chain, which translates into fewer iterations.

For evaluation of the quality of our analysis, we focus on counting pairs of labels of entire async bodies. Figure 8 shows the number of pairs of async bodies that may happen in parallel, according to our analysis, together with three exhaustive and disjoint subcategories. The legend of Figure 8 is: self $=$ an async body may happen in parallel with itself; same = two different async bodies in the same method may happen in parallel; diff = two async bodies in different methods may happen in parallel. Let us discuss each of the columns in turn. A typical scenario for the self category is:

```
while (...) { async S1 }
```

Notice that S1 may happen in parallel with itself. If we compare the self column to the total number of asyncs in the program, we can easily determine how many asyncs appear in loops (or in methods called in loops) without a finish for wrapping the async. Most of the benchmarks have a high percentage of such asyncs, which we expected as this is the easiest way to generate parallelism in X10. Some of the smaller benchmarks like series and mapreduce use just one loop to do most of the processing, but also need to perform some communication which is done with the other asyncs.

In our benchmarks, a typical scenario for the same category is:

```
while (...) {
    async {
        finish async S1
        finish async S2
    }
}
```

Here, S1 and S2 may happen in parallel because separate iterations of the loop run in parallel with each other. Such code is useful when we don't need synchronization among separate iterations of a loop but need a strict order of execution during a single iteration.

The example is Section 2.2 is a typical scenario for the diff category. For example, statements S5 and S3 may happen in parallel and are in separate methods. Most of the benchmarks have few pairs of async bodies in this category. However, one can easily move a pair from the same category to the diff category by moving an async in a loop to a method that the loop then calls. In mg , we have several methods with asyncs in their bodies that are called from several different loops. Some calls were deeply nested in several loop async bodies.

We manually examined the type-inference output for stream, fragstream, sor, series, sparsemm, crypt, and mapreduce to look for false positives, that is, pairs of async bodies that our algorithm says can happen in parallel but actually can't. We found none! For the other, larger benchmarks, the generated number of pairs is large and we performed only a brief examination and noticed no obvious false positives. Asyncs in the bodies of loops are typical
in the benchmarks and don't provide false positives unless the loop guard is always false which we believe is not the case in any of the examples we closely examined, for the inputs we used.

## 7. Context-insensitive Analysis

We will now compare our context-sensitive analysis to a contextinsensitive analysis that merges information from different call sites. Let us first explain how the context-insensitive analysis works: it uses the same set variables and constraints as our contextsensitive analysis, except for the following differences.

Variables. For every method $f_{i}$, we generate an extra set variable $r_{i}$.

Constraint generation. For $s \equiv f_{i}()^{l} k$ we add the following constraint:

$$
\begin{equation*}
r_{s} \subseteq r_{i} \tag{83}
\end{equation*}
$$

We also replace Rule (57) with the following constraint:

$$
\begin{equation*}
r_{s_{i}}=r_{i} \tag{84}
\end{equation*}
$$

The effect of these changes is a merge of the $r_{s}$ variables from different call sites. Thus, the context-insensitive analysis says that the method may happen in parallel with the labels in the sets for all those $r_{s}$ variables at once.

A subtlety is that for a context-insensitive analysis we can remove $\operatorname{Scross}_{p}\left(p\left(f_{i}\right), R\right)$ from Rule (82) without changing the analysis. This is because the pairs generated by $\operatorname{Scross}_{p}\left(p\left(f_{i}\right), R\right)$ will eventually be added anyway due to the new $r_{s} \subseteq r_{i}$ constraint.

We ran the context-insensitive analysis on our benchmarks. For the 11 smallest benchmarks, the runs used roughly the same amount of time and space, and we got the exact same results. Only for the two largest benchmarks, plasma and mg , did the context-insensitive analysis produce any additional label pairs in the may-happen-in-parallel sets. Figure (9) shows a comparison of our contextsensitive analysis and a context-insensitive analysis of plasma and mg . The context-insensitive analysis requires more time and space, and it produces many more pairs of async bodies that may happen in parallel.

The increase in run time and space usage of the contextinsensitive analysis compared to our context-sensitive analysis is somewhat unsurprising. First, the context-insensitive analysis is more conservative so the number of label pairs that are generated and copied through the constraint variables is higher. In particular, the higher number of pairs increases the time required to perform the set operations. Second, the introduction of subset constraints leads to an increase in the number of level-1 iterations. The reason is that each call site can contribute labels to $r_{i}$ and then the constraint solver needs additional iterations to propagate the additional labels amongst the constraints.

The increase in the number of label pairs is mostly for async bodies in different methods. As far as we can tell, the increase is due to a few methods that are called in many different places. Such a method can easily have an overly conservative $o$ set that then leads to many spurious pairs. The reason is that call site contributes
to the $r_{i}$ set for a method, and the set for $r_{i}$ will be a subset of $o_{i}$, so now $o_{i}$ has many elements to be paired with labels of statements that follow each call.

The example in Section 2.2 illustrates this effect. The statement S3 is running at the beginning of the first call $f()$, and so it will running when that call completes execution. Due to the merging of information from different call sites, the analysis finds that S3 is also running at the end of the second call $f()$. When the analysis consider the statement async $S 4$ that follows the second call $f()$, it will conclude that S3 and S4 may happen in parallel.

We thank Vivek Sarkar (personal communication, 2009) for the following observation. The intraprocedural analysis of [2] ignores function calls and uses the two finish statements to conclude that S3 and S4 cannot happen in parallel. The context-insensitive analysis of function calls creates an infeasible datapath from the body of one finish statement to the body of another finish statement and therefore the spurious pair of S3 and S4. In contrast, our analysis avoids such infeasible datapaths and doesn't produce the spurious pair of S3 and S4.

## 8. Conclusion

We have presented a core calculus for async-finish parallelism along with a type system for modular, context-sensitive may-happen-in-parallel analysis. Type inference is straightforward: generate and solve simple set constraints in polynomial time. Compared to a context-insensitive analysis, our context-sensitive analysis is faster, uses less space, and produces better results.

Our experiments suggest that our analysis produces few false positives and should therefore be a good basis for other static program analyses. In fact we have been unable to find any false positives at all! One way a false positive can occur is if a program has a loop that is never executed: our analysis will analyze the loop anyway. For example:
while (...) \{ async S1 \}
async S 2
Suppose the while loop is never executed. Our analysis will nevertheless say that S1 and S2 may happen in parallel. We found no occurrences of the above pattern in our benchmarks.

Our detailed proof of correctness is evidence that our core calculus is a good basis for type systems and static analyses for languages with async-finish parallelism, and tractable proofs of correctness. We leave further investigation of the precision of the analysis to future work. While our analysis produces an overapproximation of may-happen-in-parallel information, one might use a dynamic analysis that instead gives an underapproximation. The difference between an overapproximation and an underapproximation will shed light on the precision of the overapproximation.

We can straightforwardly extend our calculus to support other features of X10. For example, a worthwhile extension of our calculus would be to model the X10 notion of clocks. Another idea is to support computation with multiple places by changing trees of the form $s$ to be of the form $\langle P, s\rangle$ where $P$ is a place. A tree $\langle P, s\rangle$ means that statement $s$ is executing on place $P$. One could then consider refining our analysis by asking whether two statements may happen in parallel on the same place. We leave such an analysis to future work.

Acknowledgments. We thank Christian Grothoff, Shu-Yu Guo, Riyaz Haque, and the anonymous reviewers for helpful comments on a draft the paper.

## Appendix A: Proof of Theorem 1

(Deadlock freedom) For every state $(p, A, T)$, either $T=$ $\sqrt{ }$ or there exists $A^{\prime}, T^{\prime}$ such that $(p, A, T) \rightarrow\left(p, A^{\prime}, T^{\prime}\right)$.

Proof. We proceed by induction on $T$. We have four cases. If $T \equiv \sqrt{ }$, then the result is immediate.

If $T \equiv\langle s\rangle$, then we have from Rules (7)-(14) that there exists $A^{\prime}, T^{\prime}$ such that $(p, A, T) \rightarrow\left(p, A^{\prime}, T^{\prime}\right)$.

If $T \equiv\left(T_{1} \triangleright T_{2}\right)$, then from the induction hypothesis we have that either $T_{1}=\sqrt{ }$ or there exists $A^{\prime}, T_{1}^{\prime}$ such that $\left(p, A, T_{1}\right) \rightarrow$ $\left(p, A^{\prime}, T_{1}^{\prime}\right)$. If $T_{1}=\sqrt{ }$, then $(p, A, T)$ can take a step by Rule (1). If there exists $A^{\prime}, T_{1}^{\prime}$ such that $\left(p, A, T_{1}\right) \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)$, then ( $p, A, T$ ) can take a step by Rule (2).

If $T \equiv\left(T_{1} \| T_{2}\right)$, then from the induction hypothesis we have that either $T_{1}=\sqrt{ }$ or there exists $A^{\prime}, T_{1}^{\prime}$ such that $\left(p, A, T_{1}\right) \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)$, and we have that either $T_{2}=\sqrt{ }$ or there exists $A^{\prime}, T_{2}^{\prime}$ such that $\left(p, A, T_{2}\right) \rightarrow\left(p, A^{\prime}, T_{2}^{\prime}\right)$. In all four cases, one of Rules (3)-(6) applies to enable $(p, A, T)$ to take a step. This completes the proof of progress.

## Appendix B: Proof of Theorem 2

### 8.1 A Lemma about the Helper Functions

We begin with a lemma that states 19 useful properties of symcross, Lcross, Scross, Tcross, Slabels, FSlabels, and FTlabels.

Lemma 7. 1. $\operatorname{symcross}(A, B)=\operatorname{symcross}(B, A)$
2. If $A^{\prime} \subseteq A$ and $B^{\prime} \subseteq B$ then $\operatorname{symcross}\left(A^{\prime}, B^{\prime}\right) \subseteq \operatorname{symcross}(A, B)$.
3. $\operatorname{symcross}(A, C) \cup \operatorname{symcross}(B, C)=\operatorname{symcross}(A \cup B, C)$
4. $\operatorname{Lcross}(l, A \cup B)=\operatorname{Lcoss}(l, A) \cup \operatorname{Lcoss}(l, B)$
5. $\operatorname{Scross}_{p}(s, A \cup B)=\operatorname{Scross}_{p}(s, A) \cup \operatorname{Scross}_{p}(s, B)$
6. $\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right)\right)=\operatorname{Scross}_{p}\left(s_{2}, \operatorname{Slabel}_{p}\left(s_{1}\right)\right)$
7. $\operatorname{Tcross}_{p}(T, A \cup B)=\operatorname{Tcoss}_{p}(T, A) \cup \operatorname{Tcross}_{p}(T, B)$
8. $\operatorname{Tcross}_{p}\left(T_{1}\right.$, Tlabels $\left._{p}\left(T_{2}\right)\right)=\operatorname{Tross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right)$
9. $\operatorname{Tcross}_{p}(\sqrt{ }, A)=\emptyset$
10. If $R^{\prime} \subseteq R$ then $\operatorname{Tcross}_{p}\left(T, R^{\prime}\right) \subseteq \operatorname{Tcross}_{p}(T, R)$.
11. Slabel $_{p}\left(s_{a} \cdot s_{b}\right)=\operatorname{Slabel}_{p}\left(s_{a}\right) \cup$ Slabel $_{p}\left(s_{b}\right)$
12. FSlabels $(s) \subseteq$ Slabel $_{p}(s)$
13. FTlabels $(T) \subseteq$ Tlabels $_{p}(T)$
14. $\operatorname{symcross}\left(F\right.$ Tlabels $\left(T_{1}\right)$, FTlabels $\left.\left(T_{2}\right)\right) \subseteq$ $\operatorname{Tcross}_{p}\left(T_{1}\right.$, Tlabels $_{p}\left(T_{2}\right)$
15. If $(p, A, T) \rightarrow\left(p, A^{\prime}, T^{\prime}\right)$ then Tlabels $s_{p}\left(T^{\prime}\right) \subseteq$ Tlabel $_{p}(T)$.
16. If Slabel $s_{p}(s)=\{l\} \cup$ Slabel $_{p}(k)$ then $\operatorname{Scross}_{p}(s, R)=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}(k, R)$.
17. If Slabel $s_{p}(s)=\{l\} \cup$ Slabel $_{p}\left(s_{1}\right) \cup$ Slabel $_{p}\left(s_{2}\right)$ then $\operatorname{Scross}_{p}(s, R)=\operatorname{Lcross}(l, R) \cup$
$\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right)$.
18. $\operatorname{Tcross}_{p}(\langle s\rangle, R)=\operatorname{Scross}_{p}(s, R)$
19. If Tlabel $s_{p}(T)=$ Tlabels $_{p}\left(T_{1}\right) \cup$ Tlabels $_{p}\left(T_{2}\right)$ then $\operatorname{Tcross}_{p}(T, R)=\operatorname{Tcoss}_{p}\left(T_{1}, R\right) \cup \operatorname{Tcross}_{p}\left(T_{2}, R\right)$.

Proof.

1. By examining the definition of $\operatorname{sym} \operatorname{cross}()$ we see this is trivially true.
2. We also see that this is true by the definition of $\operatorname{sym} \operatorname{cross}()$.
3. From Lemma (7.2) we have
1) $\operatorname{symcross}(A, C) \subseteq \operatorname{symcross}(A \cup B, C)$ and 2) $\operatorname{symcross}(B, C) \subseteq \operatorname{symcross}(A \cup B, C)$, therefore giving us 3) $\operatorname{symcross}(A, C) \cup \operatorname{symcross}(B, C) \subseteq \operatorname{symcross}(A \cup$ $B, C)$. Suppose we have $l \in A \cup B$ and $l^{\prime} \in C$. This implies that $l \in A \vee l \in B$. If $l \in A$ then $\left(l, l^{\prime}\right) \in$ $\operatorname{symcross}(A, C)$. If $l \in B$ then $\left(l, l^{\prime}\right) \in \operatorname{symcross}(B, C)$. Thus we have that $\operatorname{symcross}(A \cup B, C) \subseteq \operatorname{symcross}(A, C) \cup$ $\operatorname{symcross}(B, C)$, which with 3 ) gives us our conclusion.
4. We unfold $\operatorname{Lcross}()$, then apply (7.1), (7.3) and finally can use the definition $\operatorname{Lcross}()$ again to reach our conclusion.
5. We unfold $\operatorname{Scross}_{p}()$, then apply (7.1), (7.3) and finally can use the definition $\operatorname{Scross}_{p}()$ again to reach our conclusion.
6. We unfold the definition of $\operatorname{Scross}_{p}()$, apply (7.1) and finally apply the definition of $\operatorname{Scross}_{p}()$ to reach our conclusion.
7. We unfold $\operatorname{Tcross}_{p}()$, then apply (7.1), (7.3) and finally use the definition of $\operatorname{Tcross}_{p}()$ once again to get our conclusion.
8. We unfold the definition of $\operatorname{Tcross}_{p}()$, apply (7.1) and finally apply the definition of $\operatorname{Tcross}_{p}()$ to reach our conclusion.
9. Unfolding the definition of $\operatorname{Tcross}_{p}()$ and then $\operatorname{Tlabel}_{p}()$ gives us $\operatorname{Tcross}_{p}(\sqrt{ }, A)=\operatorname{symcross}^{(\emptyset, A) \text {. From the defi- }}$ nition of symeross () we have our conclusion.
10. Let us unfold the definition of $\operatorname{Tcross}_{p}()$ and then apply (7.2) to reach our conclusion.
11. Let us perform induction on $s_{a}$. This gives us seven cases to examine.
If $s_{a} \equiv$ skip $^{l}$ then from the definition of . we have $s_{a} \cdot s_{b}=$ skip ${ }^{l} s_{b}$ and from Rule (16) Slabels $s_{p}\left(s_{a} . s_{b}\right)=\{l\} \cup$ $\operatorname{Slabels}_{p}\left(s_{b}\right)$. From Rule (15) we have Slabels $p_{p}\left(s_{a}\right)=\{l\}$. From here we can use substitution to reach our conclusion.
If $s_{a} \equiv$ skip $^{l} s_{1}$ then from the definition of . we have that $s_{a} \cdot s_{b}=\operatorname{skip}^{l}\left(s_{1} \cdot s_{b}\right)$. Using Rule (16) we have Slabels $s_{p}\left(s_{a} \cdot s_{b}\right)=\{l\} \cup$ Slabel $_{p}\left(s_{1} . s_{b}\right)$. Using the induction hypothesis we have that
$\operatorname{Slabels}_{p}\left(s_{1} \cdot s_{b}\right)={\operatorname{Slabel} s_{p}\left(s_{1}\right) \cup \text { Slabel }_{p}\left(s_{b}\right) \text {. We may }}^{2}$ now substitute that in and use Rule (16) to get our conclusion $\operatorname{Slabel}_{p}\left(s_{a} \cdot s_{b}\right)=\operatorname{Slabel}_{p}\left(\right.$ skip $\left.^{l} s_{1}\right) \cup \operatorname{Slabel}_{p}\left(s_{b}\right)=$ Slabels $s_{p}\left(s_{a}\right) \cup$ Slabels $_{p}\left(s_{b}\right)$.
If $s_{a} \equiv a[d]={ }^{l} e ; s_{1}$ then we proceed using similar reasoning as the previous case.
If $s_{a} \equiv$ while ${ }^{l}(a[d] \neq 0) s_{1} s_{2}$ then from the definition of . we have $s_{a} \cdot s_{b}=$ while $e^{l}(a[d] \neq 0) s_{1}\left(s_{2} . s_{b}\right)$. From Rule (18) we have $\operatorname{Slabel}_{p}\left(s_{a} \cdot s_{b}\right)=\{l\} \cup \operatorname{Slabel}_{p}\left(s_{1}\right) \cup$ Slabels $s_{p}\left(s_{2} . s_{b}\right)$. Using the induction hypothesis we get $\operatorname{Slabels}_{p}\left(s_{2} \cdot s_{b}\right)=\operatorname{Slabel}_{p}\left(s_{2}\right) \cup$ Slabel $_{p}\left(s_{b}\right)$. We may now substitute and use Rule (18) we get $\operatorname{Slabel}_{p}\left(s_{a} \cdot s_{b}\right)=$ Slabel $_{p}\left(\right.$ while $\left.^{l}(a[d] \neq 0) s_{1} s_{2}\right) \cup$ Slabel $_{p}\left(s_{b}\right)=$ $\operatorname{Slabel}_{p}\left(s_{a}\right) \cup$ Slabels $_{p}\left(s_{b}\right)$
If $s_{a} \equiv \operatorname{async}^{l} s_{1} s_{2}$ then we may proceed using similar logic as the previous case.
If $s_{a} \equiv$ finish $^{l} s_{1} s_{2}$ then we may proceed using similar logic as the previous case.
If $s_{a} \equiv f_{i}()^{l} k$ then from the definition of . we have $s_{a} \cdot s_{b}=$ $f_{i}()^{l}\left(s_{1} \cdot s_{b}\right)$. From Rule (21) we have $\operatorname{Slabel}_{p}\left(s_{a} \cdot s_{b}\right)=$ $\{l\} \cup$ Slabel $_{p}\left(s_{i}\right) \cup$ Slabel $_{p}\left(k . s_{b}\right)$ where $p\left(f_{i}\right)=s_{i}$. From the induction hypothesis we have that $\operatorname{Slabel}_{p}\left(k . s_{b}\right)=$ $\operatorname{Slabels}_{p}(k) \cup \operatorname{Slabels}_{p}\left(s_{b}\right)$. We substitute and use Rule (21) to get Slabels $s_{p}\left(s_{a} \cdot s_{b}\right)=\operatorname{Slabel}_{p}\left(f_{i}()^{l} k\right) \cup \operatorname{Slabels}_{p}\left(s_{b}\right)=$ $\operatorname{Slabel}_{p}\left(s_{a}\right) \cup$ Slabel $_{p}\left(s_{b}\right)$.
12. Let us perform case analysis on $s$. As we examine each case with the definitions of $F \operatorname{Slabels}()$ and $\operatorname{Slabels}_{p}()$ we see that the conclusion is obvious.
13. Let us perform induction on $T$. This gives us four cases.

If $T \equiv \sqrt{ }$ then examining the definitions we see $F$ Tlabels $(\sqrt{ })=$ Tlabel $s_{p}(\sqrt{ })$. The conclusion is obviously true.
If $T \equiv T_{1} \triangleright T_{2}$ then FTlabels $(T)=F$ Tlabels $\left(T_{1}\right)$ and Tlabels $_{p}(T)=$ Tlabels $_{p}\left(T_{1}\right) \cup$ Tlabels $_{p}\left(T_{2}\right)$. From the induction hypothesis we have that $F$ Tlabels $\left(T_{1}\right) \subseteq$ Tlabels $_{p}\left(T_{1}\right)$ and thus we can see that our conclusion is true.
If $T \equiv T_{1} \| T_{2}$ then
FTlabels $(T)=$ FTlabels $\left(T_{1}\right) \cup$ FTlabels $\left(T_{2}\right)$ and Tlabels $_{p}(T)=$ Tlabel $_{p}\left(T_{1}\right) \cup$ Tlabels $_{p}\left(T_{2}\right)$. From the induction hypothesis we have that $F$ Tlabels $\left(T_{1}\right) \subseteq$ Tlabels $_{p}\left(T_{1}\right)$ and FTlabels $\left(T_{2}\right) \subseteq$ Tlabels $_{p}\left(T_{2}\right)$. From here it is easy to reach our conclusion.
If $T \equiv\langle s\rangle$ then examining the definitions we see
$F$ Tlabels $(T)=F \operatorname{Slabels}(s)$ and
Tlabels $_{p}(T)=$ Slabel $_{p}(s)$. From (7.12) we reach our conclusion.
14. From (7.13) we have 1) FTlabels $\left(T_{1}\right) \subseteq \operatorname{Tlabels}_{p}\left(T_{1}\right)$ and 2) FTlabels $\left(T_{2}\right) \subseteq$ Tlabels $_{p}\left(T_{2}\right)$. From unfolding $\operatorname{Tcross}()$ we have 3) $\operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right)=$ symcross $^{\left(\text {Tlabels }_{p}\left(T_{1}\right), \text { Tlabels }_{p}\left(T_{2}\right)\right) \text {. Using (7.2) with 1) }}$ and 2) gives us
4) $\operatorname{symcross}\left(F T \operatorname{labels}\left(T_{1}\right), F \operatorname{Tlabels}\left(T_{2}\right)\right) \subseteq$
$\operatorname{symcross}_{\left(\text {Tlabels }_{p}\left(T_{1}\right), \text { Tlabel }_{p}\left(T_{2}\right)\right) \text {. From 3) and 4) we }}^{\text {4 }}$ have our conclusion.
15. Let us perform induction on $T$. This gives us four cases.

If $T \equiv \sqrt{ }$ then we do not take a step.
If $T \equiv T_{1} \triangleright T_{2}$ then there are two rules by which we may take a step.
Suppose we step by Rule (1) and $T^{\prime}=T_{2}$. From the definition of Tlabels $s_{p}()$ we have Tlabels $_{p}(T)=\operatorname{Tlabels}_{p}\left(T_{1}\right) \cup$ Tlabels $_{p}\left(T_{2}\right)$ and Tlabels $_{p}\left(T^{\prime}\right)=$ Tlabels $_{p}\left(T_{2}\right)$. We see from this that the conclusion is true.
Suppose we step by Rule (2) then we have 1) $T^{\prime}=T_{1}^{\prime} \triangleright T_{2}$ and 2) $\left(p, A, T_{1}\right) \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)$. Unfolding the definition of Tlabels $_{p}()$ we have 3) Tlabels $_{p}(T)=$ Tlabels $_{p}\left(T_{1}\right) \cup$ Tlabels ${ }_{p}\left(T_{2}\right)$ and
4) Tlabels $_{p}\left(T^{\prime}\right)=$ Tlabels $_{p}\left(T_{1}^{\prime}\right) \cup$ Tlabels $_{p}\left(T_{2}\right)$. From the induction hypothesis we have that 3) $\operatorname{Tlabels}_{p}\left(T_{1}^{\prime}\right) \subseteq$ Tlabels $_{p}\left(T_{1}\right)$ and from here we easily may arrive at the conclusion.
If $T \equiv T_{1} \| T_{2}$ then there are four rules by which we can step. Suppose we step by Rule (3) then we may use similar logic as the case where $T \equiv T_{1} \triangleright T_{2}$ and we step by Rule (1).
Suppose we step by Rule (4) then we proceed using similar logic as the previous case.
Suppose we step by Rule (5) then we may use similar logic as the case where $T \equiv T_{1} \triangleright T_{2}$ and we step by Rule (2).
Suppose we step by Rule (6) then we may proceed using similar logic as the previous case.
If $T \equiv\langle s\rangle$ then we now perform induction on $s$ to give us an additional seven cases.
If $s \equiv s k i p^{l}$ then we step by Rule (7) and $T^{\prime}=\sqrt{ }$. From the definition of Tlabels() we have $\operatorname{Tlabels}_{p}\left(T^{\prime}\right)=\emptyset$ and Tlabel $_{p}(T)=\{l\}$. Thus we see that the conclusion is true.
If $s \equiv s k i p^{l} s_{1}$ then we step by Rule (8) and $T^{\prime}=\left\langle s_{1}\right\rangle$. We see that by the definition of Tlabels () that Tlabels $_{p}\left(T^{\prime}\right)=$ Slabels $_{p}\left(s_{1}\right)$ and Tlabel $_{p}(T)=\{l\} \cup$ Slabel $_{p}\left(s_{1}\right)$. We now can easily arrive at the conclusion.
If $s \equiv a[d]={ }^{l} e ; s_{1}$ then we step by Rule (9) and proceed using similar reasoning as the previous case.
If $s \equiv$ while $e^{l}(a[d] \neq 0) s_{1} s_{2}$ then there are two rules by which we may take a step.
Suppose we step by Rule (10) then $T^{\prime}=\left\langle s_{2}\right\rangle$. From the definition of Tlabels $s_{p}()$ we have Tlabels $p_{p}\left(T^{\prime}\right)=\operatorname{Slabels}_{p}\left(s_{2}\right)$ and Tlabel $_{p}(T)=\{l\} \cup$ Slabel $_{p}\left(s_{1}\right) \cup \operatorname{Slabel}_{p}\left(s_{2}\right)$. The conclusion is obvious.
Suppose we step by Rule (11) then $T^{\prime}=\left\langle s_{1}\right.$. while ${ }^{l}(a[d] \neq$ $\left.0) s_{1} s_{2}\right\rangle$. From the definition of $\operatorname{Tlabel} s_{p}()$ and (7.11) we have Tlabel $_{p}\left(T^{\prime}\right)=$ Slabels $_{p}\left(s_{1}\right) \cup\{l\} \cup$ Slabel $_{p}\left(s_{1}\right) \cup$ Slabel $_{p}\left(s_{2}\right)=$ Slabels $_{p}(s)$ and Tlabel $_{p}(T)=\operatorname{Slabels}_{p}(s)$. The conclusion is obviously true.
If $s \equiv a^{2} y n c^{l} s_{1} s_{2}$ then we step by Rule (12) and $T^{\prime}=$ $\left\langle s_{1}\right\rangle \|\left\langle s_{2}\right\rangle$. Using the definition of Tlabels $s_{p}()$ we have
Tlabel $_{p}\left(T^{\prime}\right)=\operatorname{Slabel}_{p}\left(s_{1}\right) \cup$ Slabel $_{p}\left(s_{2}\right)$ and
Tlabel $_{p}(T)=\{l\} \cup$ Slabels $_{p}\left(s_{1}\right) \cup$ Slabels $_{p}\left(s_{2}\right)$. The conclusion is now obvious.
If $s \equiv$ finish ${ }^{l} s_{1} s_{2}$ then we step by Rule (13) and $T^{\prime}=$ $\left\langle s_{1}\right\rangle \triangleright\left\langle s_{2}\right\rangle$. From the definition of Tlabels $s_{p}()$
we get Tlabels $_{p}\left(T^{\prime}\right)=\operatorname{Slabel}_{p}\left(s_{1}\right) \cup \operatorname{Slabel}_{p}\left(s_{2}\right)$ and
$\operatorname{Tlabels}_{p}(T)=\{l\} \cup$ Slabels $_{p}\left(s_{1}\right) \cup$ Slabel $_{p}\left(s_{2}\right)$. The conclusion is easily reached from here.
If $s \equiv f_{i}()^{l} s_{1}$ then we step by Rule (14) and $T^{\prime}=\left\langle s_{i} . s_{1}\right\rangle$ where $p\left(f_{i}\right)=s_{i}$. From the definition of Tlabel $_{p}()$ we get Tlabels $_{p}\left(T^{\prime}\right)=\operatorname{Slabels}_{p}\left(s_{i} . s_{1}\right)$ and Tlabel $_{p}(T)=$ $\{l\} \cup \operatorname{Slabels}_{p}\left(s_{i}\right) \cup$ Slabel $_{p}\left(s_{1}\right)$. From (7.11) we have $\operatorname{Slabels}_{p}\left(s_{i} . s_{1}\right)=\operatorname{Slabel}_{p}\left(s_{i}\right) \cup \operatorname{Slabel}_{p}\left(s_{1}\right)$. From here we can easily arrive at our conclusion.
16. Let us unfold the definition of $\operatorname{Scross}()$ to get

1) $\operatorname{Scross}_{p}(s, R)=\operatorname{symcross}_{\left(\operatorname{Slabels}_{p}(s), R\right) \text {. We may }}$ now substitute to get 2$) \operatorname{Scross}_{p}(s, R)=\operatorname{symcross}(\{l\} \cup$
$\left.\operatorname{Slabels}_{p}(k), R\right)$. Let us apply the (7.3) to get
2) $\operatorname{Scross}_{p}(s, R)=\operatorname{symcross}(\{l\}, R) \cup$
symcross $\left(\operatorname{Slabels}_{p}(k), R\right)$. We may now use the definitions of $\operatorname{Lcross}()$ and $\operatorname{Scross}_{p}()$ achieve our conclusion.
17. Let us use the definition of $\operatorname{Scross}()$ to get 1) $\operatorname{Scross}_{p}(s, R)=$ $\left.\operatorname{symcross}^{(S l a b e l s}(s), R\right)$. We may substitute to get
2) $\operatorname{Scross}_{p}(s, R)=\operatorname{symcross}\left(\{l\} \cup \operatorname{Slabels}_{p}\left(s_{1}\right) \cup\right.$
$\left.\operatorname{Slabels}_{p}\left(s_{2}\right), R\right)$. Using (7.3) we can get 3) $\operatorname{Scross}_{p}(s, R)=$ $\operatorname{symcross}(\{l\}, R) \cup \operatorname{symcross}\left(\operatorname{Slabel}_{p}\left(s_{1}\right), R\right) \cup$
symcross $\left(\operatorname{Slabels}_{p}\left(s_{2}\right), R\right)$. We may now use the definition of $\operatorname{Lcross}()$ and $\operatorname{Scross}_{p}()$ to arrive at our conclusion.
18. Unfolding $\operatorname{Tcross}()$ gives us
1) $\operatorname{Tcross}_{p}(\langle s\rangle, R)=\operatorname{symcross}_{\left(\operatorname{Tlabel}_{p}(s), R\right) \text {. We un- }}$ fold Tlabels $s_{p}()$ to get
2) $\operatorname{Tcross}_{p}(\langle s\rangle, R)=\operatorname{symcross}^{\left(\operatorname{Slabels}_{p}(s), R\right) \text {. We apply }}$ the definition of $\operatorname{Scross}_{p}()$ to get our conclusion $\operatorname{Tcross}_{p}(\langle s\rangle, R)=\operatorname{Scross}_{p}(s, R)$.
19. Let us unfold the definition of $\operatorname{Tross}_{p}()$ to get
1) $\operatorname{Tcross}_{p}(T, R)=\operatorname{symcross}_{\left(\operatorname{Tlabels}_{p}(T), R\right) \text {. Substitut- }}$ ing the premise in 1) gives us 2) $\operatorname{Tcross}_{p}(T, R)=$
 on 2) to get 3) $\operatorname{Tcross}_{p}(T, R)=$
 Finally we apply the definition of $\operatorname{Tcross}()$ on 3 ) to get our conclusion,
$\operatorname{Tcross}_{p}(T, R)=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup \operatorname{Tcross}_{p}\left(T_{2}, R\right)$.

### 8.2 Unique Typing

We first observe that any label set $R$ and statement $s$ will always uniquely determine $M$ and $O$. We will use this property often to show that types are equal.

Lemma 8. If $p, E, R \vdash s: M_{1}, O_{1}$ and $p, E, R \vdash s: M_{2}, O_{2}$ then $M_{1}=M_{2}$ and $O_{1}=O_{2}$.

Proof. Let us perform induction on $s$ and examine the seven cases.
If $s \equiv s k i p^{l}$ the conclusion is immediately obvious from Rule (50).

If $s \equiv$ skip $^{l} s_{1}$ then from Rule (51) we have 1) $p, E, R \vdash$ $s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 2) $M_{1}=\operatorname{Lcross}(l, R) \cup M_{1}^{\prime}$, 3) $O_{1}=O_{1}^{\prime}$, 4) $\left.p, E, R \vdash s_{1}: M_{2}^{\prime}, O_{2}^{\prime}, 5\right) M_{2}=\operatorname{Lcross}(l, R) \cup M_{2}^{\prime}$ and 6) $O_{2}=O_{2}^{\prime}$. Using the induction hypothesis on 1) and 4) we get 7) $M_{1}^{\prime}=M_{2}^{\prime}$ and 8) $O_{1}^{\prime}=O_{2}^{\prime}$. Applying some substitution among 2),3),5),6),7) and 8) we arrive at our conclusion $M_{1}=M_{2}$ and $O_{1}=O_{2}$.

If $s \equiv a[d]={ }^{l} e ; s_{1}$ then we may proceed using similar reasoning as the previous case.

If $s \equiv$ while $^{l}(a[d] \neq 0) s_{1} s_{2}$ then from Rule (53) we have 1) $p, E, R \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 2) $p, E, O_{1}^{\prime} \vdash s_{2}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}$, 3) $M_{1}=\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{1}^{\prime \prime}$, 4) $O_{1}=O_{1}^{\prime \prime}$, 5) $\left.p, E, R \vdash s_{1}: M_{2}^{\prime}, O_{2}^{\prime}, 6\right) p, E, O_{2}^{\prime} \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}$, 7) $M_{2}=\operatorname{Lcross}\left(l, O_{2}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{2}^{\prime}\right) \cup M_{2}^{\prime} \cup M_{2}^{\prime \prime}$ and 8) $O_{2}=O_{2}^{\prime \prime}$. Let us apply the induction hypothesis on 1) and 5) to get 9) $M_{1}^{\prime}=M_{2}^{\prime}$ and 10) $O_{1}^{\prime}=O_{2}^{\prime}$. From 10) we are able to apply the induction hypothesis on 2) and 6) to get 11) $M_{1}^{\prime \prime}=M_{2}^{\prime \prime}$ and 12) $O_{1}^{\prime \prime}=O_{2}^{\prime \prime}$. Using substitution with 9 ),10),11) and 12) in 3),4),7) and 8) we get our conclusion $M_{1}=M_{2}$ and $O_{1}=O_{2}$.

If $s \equiv \operatorname{async}^{l} s_{1} s_{2}$ then from Rule (54) we have 1) $p, E$, Slabel $\left.s_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}, 2\right) p, E$, Slabel $s_{p}\left(s_{1}\right) \cup$ $\left.R \vdash s_{2}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}, 3\right) M_{1}=\operatorname{Lcross}(l, R) \cup M_{1}^{\prime} \cup M_{1}^{\prime \prime}$, 4) $O_{1}=O_{1}^{\prime \prime}$, 5) $p, E$, Slabel $\left.s_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{2}^{\prime}, O_{2}^{\prime}, 6\right)$ $p, E$, Slabels $\left.p_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}, 7\right) M_{2}=\operatorname{Lcross}(l, R) \cup$ $M_{2}^{\prime} \cup M_{2}^{\prime \prime}$ and 8) $O_{2}=O_{2}^{\prime \prime}$. We may apply the induction hypothesis on 1) and 5) and 2) and 6) to get 9) $\left.M_{1}^{\prime}=M_{2}^{\prime}, 10\right) O_{1}^{\prime}=O_{2}^{\prime}$,
11) $M_{1}^{\prime \prime}=M_{2}^{\prime \prime}$ and 12) $O_{1}^{\prime \prime}=O_{2}^{\prime \prime}$. Substituting 9), 10),11) and 12) in 3),4),7) and 8) we get our conclusion $M_{1}=M_{2}$ and $O_{1}=O_{2}$.

If $s \equiv$ finish $^{l} s_{1} s_{2}$ then we may proceed using similar reasoning as the previous case.

If $s \equiv f_{i}()^{l} k$ then from Rule (56) we have 1) $E\left(f_{i}\right)=$ $\left.\left.\left(M_{i}, O_{i}\right), 2\right) p, E, R \cup O_{i} \vdash s_{1}: M_{k}^{\prime}, O_{k}^{\prime}, 3\right) M_{1}=\operatorname{Lcross}(l, R) \cup$ symcross $\left(\operatorname{Slabels}_{p}\left(p\left(f_{i}\right), R\right) \cup M_{i} \cup M_{k}^{\prime}\right.$, 4) $O_{1}=O_{k}^{\prime}$, 5) $\left.p, E, R \cup O_{i} \vdash s_{k}: M_{k}^{\prime \prime}, O_{k}^{\prime \prime}, 6\right) M_{2}=\operatorname{Lcross}(l, R) \cup$ $\operatorname{symcross}^{(S l a b e l} \operatorname{Sl}_{p}\left(p\left(f_{i}\right), R\right) \cup M_{i} \cup M_{k}^{\prime \prime}$ and 7) $O_{2}=O_{k}^{\prime \prime}$. From applying the induction hypothesis with 2) and 5) we get 8) $M_{k}^{\prime}=M_{k}^{\prime \prime}$ and 9) $O_{k}^{\prime}=O_{k}^{\prime \prime}$. Substituting 6) and 8) in 3) we get 10) $M_{1}=M_{2}$. Substituting 7) and 9) in 4) we obtain 11) $O_{1}=O_{2}$. From 10) and 11) we have our conclusion.

The next lemma is similar to the previous lemma, but works for trees: any $R$ and $T$ uniquely determines $M$.

Lemma 9. If $p, E, R \vdash T: M$ and $p, E, R \vdash T: M^{\prime}$ then $M=M^{\prime}$.

Proof. Let us perform induction on $T$. There are four cases.
If $T \equiv \sqrt{ }$ then from Rule (49) we have 1) $M=\emptyset$ and 2) $M^{\prime}=\emptyset$. It is obvious that $M=M^{\prime}$.

If $T \equiv T_{1} \triangleright T_{2}$ then from Rule (46) we have 1) $p, E, R \vdash$ $\left.T_{1}: M_{1}, 2\right) p, E, R \vdash T_{2}: M_{2}$, 3) $M=M_{1} \cup M_{2}$, 4) $\left.p, E, R \vdash T_{1}: M_{1}^{\prime}, 5\right) p, E, R \vdash T_{2}: M_{2}^{\prime}$ and 6) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. From the induction hypothesis applied to 1) and 4) and to 2) and 5) we get 7) $M_{1}=M_{1}^{\prime}$ and 8) $M_{2}=M_{2}^{\prime}$. From 3),6),7) and 8) we see $M=M^{\prime}$.

If $T \equiv T_{1} \| T_{2}$ then from Rule (47) we have

1) $p, E$, Tlabels $s_{p}\left(T_{2}\right) \cup R \vdash T_{1}: M_{1}$, 2) $p, E$, Tlabel $s_{p}\left(T_{1}\right) \cup$ $\left.R \vdash T_{2}: M_{2}, 3\right) M=M_{1} \cup M_{2}$, 4) $p, E$, Tlabels $_{p}\left(T_{2}\right) \cup R \vdash T_{1}$ : $\left.M_{1}^{\prime}, 5\right) p, E$, Tlabels $p_{p}\left(T_{1}\right) \cup R \vdash T_{2}: M_{2}^{\prime}$ and 6) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. We use the induction hypothesis on 1) and 4) and on 2) and 5) to get 7) $M_{1}=M_{1}^{\prime}$ and 8) $M_{2}=M_{2}^{\prime}$. From 3),6),7) and 8) we get $M=M^{\prime}$.

If $T \equiv\langle s\rangle$ then from Rule (48) we have 1) $p, E, R \vdash s:$ $\left.\left.M_{s}, O_{s}, 2\right) M=M_{s}, 3\right) p, E, R \vdash s: M_{s}^{\prime}, O_{s}^{\prime}$, 4) $M^{\prime}=M_{s}^{\prime}$. From Lemma (8) applied to 1) and 3) we have 5) $M_{s}=M_{s}^{\prime}$. From 2),4) and 5) we have $M=M^{\prime}$.

### 8.3 Principal Typing

The following lemma shows that if a statement is typable with a set $R$, then it will also be typable with a set $R^{\prime}$. This is convenient for showing the existence of a type when we perform induction in the proofs of later lemmas; once we have such a type, we can then use the unique-typing lemmas to relate the type to other types.

Lemma 10. If $p, E, R \vdash s: M, O$ then there exists $M^{\prime}$ and $O^{\prime}$ such that $p, E, R^{\prime} \vdash s: M^{\prime}, O^{\prime}$.

Proof. Let us perform induction on $s$. This gives us seven cases to examine.

If $s \equiv \operatorname{skip}^{l}$ then from Rule (50) we let $M=\operatorname{Lcross}\left(l, R^{\prime}\right)$ and $O=R^{\prime}$.

If $s \equiv \operatorname{skip}^{l} s_{1}$ then from Rule (51) we have 1) $p, E, R \vdash s_{1}$ : $M_{1}, O_{1}$. Using the induction hypothesis with 1) we have that there exists $M_{1}^{\prime}$ and $O_{1}^{\prime}$ such that 2) $p, E, R^{\prime} \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$. Then by Rule (51) we let $M=\operatorname{Lcosos}\left(l, R^{\prime}\right) \cup M_{1}$ and $O=O_{1}^{\prime}$.

If $s \equiv a[d]=^{l} e ; s_{1}$ then we proceed using similar logic as the previous case.

If $s \equiv$ while $^{l}(a[d] \neq 0) s_{1} s_{2}$ then by Rule (53) we have 1) $p, E, R \vdash s_{1}: M_{1}, O_{1}$ and 2) $p, E, O_{1} \vdash s_{2}: M_{2}, O_{2}$. Using the induction hypothesis with 1) and 2) we have that there exists $M_{1}^{\prime}, M_{2}^{\prime}, O_{1}^{\prime}$ and $O_{2}^{\prime}$ such that 3) $p, E, R^{\prime} \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$ and 4) $p, E, O_{1}^{\prime} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$. Then from Rule (53) we let $M=L \operatorname{cross}\left(l, R^{\prime}\right) \cup \operatorname{Scoss}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1} \cup M_{2}$ and $O=O_{2}^{\prime}$.

If $s \equiv$ async $^{l} s_{1} s_{2}$ then by Rule (54) we have

1) $p, E$, Slabels $s_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}, O_{1}$ and
2) $p, E$, $\operatorname{Slabels}_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}, O_{2}$. We may use the induction hypothesis with 1) and 2) go get that there exists $M_{1}^{\prime}, M_{2}^{\prime}, O_{1}^{\prime}$ and $O_{2}^{\prime}$ such that 3) $p, E$, $\operatorname{Slabels}_{p}\left(s_{2}\right) \cup R^{\prime} \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$ and 4) $p, E$, Slabel $_{p}\left(s_{1}\right) \cup R^{\prime} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$. Then from Rule (54) we let $M=\operatorname{Lcross}\left(l, R^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$ and $O=O_{2}^{\prime}$.

If $s \equiv$ finish $^{l} s_{1} s_{2}$ then from Rule (55) we have 1) $p, E, R \vdash$ $s_{1}: M_{1}, O_{1}$ and 2) $p, E, R \vdash s_{2}: M_{2}, O_{2}$. We use the induction hypothesis with 1) and 2) to get that there exists $M_{1}^{\prime}, M_{2}^{\prime}, O_{1}^{\prime}$ and $O_{2}^{\prime}$ such that 3) $p, E, R^{\prime} \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$ and 4) $p, E, R^{\prime} \vdash s_{2}$ : $M_{2}^{\prime}, O_{2}$. Then from Rule (55) we let $M=\operatorname{Lcross}\left(l, R^{\prime}\right) \cup M_{1}^{\prime} \cup$ $M_{2}^{\prime}$ and $O=O_{2}^{\prime}$.

If $s \equiv f_{i}() k$ then by Rule (56) we have 1) $E\left(f_{i}\right)=\left(M_{i}, O_{i}\right)$ and 2) $p, E, R \cup O_{i} \vdash k: M^{\prime}, O^{\prime}$. Using the induction hypothesis with 2) we have that there exists $M^{\prime \prime}$ and $O^{\prime \prime}$ such that 3) $p, E, R^{\prime} \cup$ $O_{i} \vdash k: M^{\prime \prime}, O^{\prime \prime}$. With 1) and 3) we may apply Rule (56) with $M^{\prime}=\operatorname{Lcross}^{\prime}\left(l, R^{\prime}\right) \cup \operatorname{symcross}^{\prime}\left(\operatorname{Slabel}_{p}\left(p\left(f_{i}\right)\right), R^{\prime}\right) \cup M_{i} \cup M^{\prime \prime}$ and $O^{\prime}=O^{\prime \prime}$ to reach our conclusion.

Again, we need a similar lemma for execution trees.
Lemma 11. If $p, E, R \vdash T: M$ then there exists $M^{\prime}$ such that $p, E, R^{\prime} \vdash T: M^{\prime}$.
Proof. Let us perform induction on $T$. There are four cases.
If $T \equiv \sqrt{ }$ then by Rule (49) we let $M^{\prime}=\emptyset$.
If $T \equiv T_{1} \triangleright T_{2}$ then from Rule (46) we have 1) $p, E, R \vdash$ $T_{1}: M_{1}$ and 2) $p, E, R \vdash T_{2}: M_{2}$. We may use the induction hypothesis with 1) and 2) to get that there exists $M_{1}^{\prime}$ and $M_{2}^{\prime}$ such that 3) $p, E, R^{\prime} \vdash T_{1}: M_{1}^{\prime}$ and 4) $p, E, R^{\prime} \vdash T_{2}: M_{2}^{\prime}$. By Rule (46) we let $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$.

If $T \equiv T_{1} \| T_{2}$ the we may use similar logic as with the previous case.

If $T \equiv\langle s\rangle$ then from Rule (48) we have 1) $p, E, R \vdash s: M, O$. We use Lemma (10) with 1) and we have that there exists $M^{\prime \prime}$ and $O^{\prime \prime}$ such that $p, E, R^{\prime} \vdash s: M^{\prime \prime}, O^{\prime \prime}$. Then by Rule (48) we let $M^{\prime}=M^{\prime \prime}$.

The following lemma is our principal typing lemma for statements. Intuitively, we have a mapping $\pi$ from a typing to a set of typings, and if we produce a typing $\mathcal{T}$ for a statement $s$ with $R=\emptyset$, then $\pi(\mathcal{T})$ are exactly all the possible typings of $s$. Our mapping $\pi$ consists simply of creating appropriate set unions. The idea is that for a judgment $p, E, R \vdash s: M, O$, the statements with labels in $R$ may still be running when $s$ terminates so if we have a judgment $p, E, \emptyset \vdash s: M^{\prime}, O^{\prime}$, then $O$ must be the union of $R$ and $O^{\prime}$. Also, those statement with labels in $R$ may run in parallel with any statement in $s$, hence $M$ is the union of $\operatorname{Scross}_{p}(s, R)$ and $M^{\prime}$.

Lemma 12. $p, E, R \vdash s: M, O$ if and only if there exists $M^{\prime}$ and $O^{\prime}$ such that $p, E, \emptyset \vdash s: M^{\prime}, O^{\prime}$ and $M=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$ and $O=R \cup O^{\prime}$.

Proof. $\Rightarrow$ ) We may use Lemma (10) with the premise to get that there exists $M^{\prime}$ and $O^{\prime}$ such that $p, E, \emptyset \vdash s: M^{\prime}, O^{\prime}$. We next perform induction on $s$. We have seven cases to examine and show that $M=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$ and $O=R \cup O^{\prime}$.

If $s \equiv s k i p^{l}$ then by Rule (50) and using the definition of $\operatorname{Lcross}()$ we have 1) $M^{\prime}=\emptyset$, 2) $\left.O^{\prime}=\emptyset, 3\right) M=$ $\operatorname{symcross}(\{l\}, R)$, and 4) $O=R$. Using Rule (15) and the definition of $\operatorname{Scross}()$ we have 5) $M=\operatorname{symcross}(\operatorname{Slabels}(s), R)=$ $\operatorname{Scross}_{p}(s, R)$. We can now easily see from 1),2),4) and 5) that $M=S \operatorname{cross}_{p}(s, R) \cup M^{\prime}$ and $O=R \cup O^{\prime}$.

If $s \equiv s k i{ }^{l}{ }^{l} s_{1}$ then by Rule (51) and the definition of $\operatorname{Lcross}()$ we have 1) $\left.p, E, \emptyset \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}, 2\right) M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup$ $M_{1}^{\prime}=M_{1}^{\prime}$, 3) $O^{\prime}=O_{1}^{\prime}$ 4) $\left.p, E, R \vdash s_{1}: M_{1}, O_{1}, 5\right) M=$
$\operatorname{Lcross}(l, R) \cup M_{1}$, and 6) $O=O_{1}$. Using the induction hypothesis on 1) and 4) we get 7) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$ and 8) $O_{1}=$ $R \cup O_{1}^{\prime}$. Let us substitute 7) in 5) to get 9 ) $M=\operatorname{Lcross}(l, R) \cup$ $\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$. By using Rule (16), Lemma (7.16) and 2) we get $M=\operatorname{Scross} p(s, R) \cup M_{1}^{\prime}=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$. Finally using 3 ), 6), and 8 ) we may perform substitution to get $O=O_{1}=R \cup O_{1}^{\prime}=R \cup O^{\prime}$ and thus we have our conclusion.

If $s \equiv a[d]{ }^{l} e ; s_{1}$ we may proceed using similar reasoning as the previous case.

If $s \equiv$ while ${ }^{i}(a[d] \neq 0) s_{1} s_{2}$ then by Rule (53) we have 1) $\left.p, E, \emptyset \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}, 2\right) p, E, O_{1}^{\prime} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$, 3) $M^{\prime}=\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$, 4) $O^{\prime}=O_{2}^{\prime}$, 5) $\left.p, E, R \vdash s_{1}: M_{1}, O_{1},{ }^{6}\right) p, E, O_{1} \vdash s_{2}: M_{2}, O_{2}$, 7) $M=\operatorname{Lcross}\left(l, O_{1}\right) \cup S \operatorname{Cross}_{p}\left(s_{1}, O_{1}\right) \cup M_{1} \cup M_{2}$, and 8) $O=O_{2}$. From the induction hypothesis and Lemma (8) applied to 2),5) and 6) we have 9) $p, E, \emptyset \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}$, 10) $M_{2}^{\prime}=\operatorname{Scross}_{p}\left(s_{2}, O_{1}^{\prime}\right) \cup M_{2}^{\prime \prime}$, 11) $O_{2}^{\prime}=O_{1}^{\prime} \cup O_{2}^{\prime \prime}$, 12) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$, 13) $\left.O_{1}=R \cup O_{1}^{\prime}, 14\right)$ $M_{2}=\operatorname{Scross}_{p}\left(s_{2}, O_{1}\right) \cup M_{2}^{\prime \prime}$ and 15) $O_{2}=O_{1} \cup O_{2}^{\prime \prime}$. Substituting 10) in 3); 12),13) and 14) in 7); 11) in 4); and 13) and 15) in 8) yields 16) $M^{\prime}=\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup S \operatorname{cross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup$ $M_{1}^{\prime} \cup \operatorname{Sross}_{p}\left(s_{2}, O_{1}^{\prime}\right) \cup M_{2}^{\prime \prime}$, 17) $M=\operatorname{Lcross}\left(l, R \cup O_{1}^{\prime}\right) \cup$ $\operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime} \cup S \operatorname{Sross}_{p}\left(s_{2}, R \cup\right.$ $\left.O_{1}^{\prime}\right) \cup M_{2}^{\prime \prime}$, 18) $O^{\prime}=O_{1}^{\prime} \cup O_{2}^{\prime \prime}$ and 19) $O=R \cup O_{1}^{\prime} \cup O_{2}^{\prime \prime}$. Using Lemma (7.4) and (7.5) on 17) we have 20) $M=\operatorname{Lcross}(l, R) \cup$ $\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right) \cup \operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup$
$\operatorname{Scross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{2}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime \prime}$.
Using Lemma (7.17) with Rule (18) on 20) we get 21) $M=$ $\operatorname{Scross}_{p}(s, R) \cup \operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup S \operatorname{cross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup$
$\operatorname{Scross}_{p}\left(s_{2}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime \prime}$. We may substitute 16) in 21) to get $M=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$ and then substitute 18) in 19) to get $O=R \cup O^{\prime}$.

If $s \equiv$ async $^{l} s_{1} s_{2}$ then by Rule (54) we have 1) $p, E$, Slabels $\left.s_{p}\left(s_{2}\right) \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}, 2\right) p, E$, Slabel $_{p}\left(s_{1}\right) \vdash$ $\left.s_{2}: M_{2}^{\prime}, O_{2}^{\prime}, 3\right) M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup M_{1}^{\prime} \cup M_{2}^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$, 4) $O^{\prime}=O_{2}^{\prime}$, 5) $p, E$, $\left.\operatorname{Slabels}_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}, O_{1}, 6\right)$ $p, E$, Slabels $\left.s_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}, O_{2}, 7\right) M=\operatorname{Lcross}(l, R) \cup$ $M_{1} \cup M_{2}$, and 8) $O=O_{2}$. We may apply the induction hypothesis and Lemma (8) to 1),2),5) and 6) to get 9) $p, E, \emptyset \vdash s_{1}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}$, 10) $p, E, \emptyset \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}$,
11) $M_{1}^{\prime}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right)\right) \cup M_{1}^{\prime \prime}$,
12) $M_{2}^{\prime}=\operatorname{Scross}_{p}\left(s_{2}, \operatorname{Slabels}_{p}\left(s_{1}\right)\right) \cup M_{2}^{\prime \prime}$,
13) $O_{2}^{\prime}=$ Slabels $_{p}\left(s_{1}\right) \cup O_{2}^{\prime \prime}$,
14) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabel}_{p}\left(s_{2}\right) \cup R\right) \cup M_{1}^{\prime \prime}$, 15) $M_{2}=$ $\operatorname{Scross}_{p}\left(s_{2}\right.$, Slabel $\left._{p}\left(s_{1}\right) \cup R\right) \cup M_{2}^{\prime \prime}$ and
16) $O_{2}=\operatorname{Slabels}_{p}\left(s_{1}\right) \cup R \cup O_{2}^{\prime \prime}$. We now substitute 11) and 12) in 3); 14) and 15) in 7) to get 17) $M^{\prime}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right)\right) \cup$ $M_{1}^{\prime \prime} \cup \operatorname{Scross}_{p}\left(s_{2}\right.$, Slabels $\left._{p}\left(s_{1}\right)\right) \cup M_{2}^{\prime \prime}$ and
18) $M=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabel}_{p}\left(s_{2}\right) \cup R\right) \cup M_{1}^{\prime \prime} \cup$ $\operatorname{Scross}_{p}\left(s_{2}, \operatorname{Slabels}_{p}\left(s_{1}\right) \cup R\right) \cup M_{2}^{\prime \prime}$. Using Lemma (7.5) on 18) then substituting in 17) we get 19) $M=\operatorname{Lcross}(l, R) \cup$ $\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M^{\prime}$. We now apply
Lemma (7.17) with Rule (19) to get $M=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$. Finally from 4),8),13) and 16) we have $O=R \cup O^{\prime}$.

If $s \equiv$ finish $^{l} s_{1} s_{2}$ then by Rule (55) we have 1) $p, E, \emptyset \vdash$ $s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 2) $p, E, \emptyset \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$, 3) $M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup$ $M_{1}^{\prime} \cup M_{2}^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$, 4) $O^{\prime}=O_{2}^{\prime}$, 5) $p, E, R \vdash s_{1}: M_{1}, O_{1}$, 6) $\left.p, E, R \vdash s_{2}: M_{2}, O_{2}, 7\right) M=\operatorname{Lcross}(l, R) \cup M_{1} \cup M_{2}$, and 8) $O=O_{2}$. Let us apply the induction hypothesis with Lemma (8) on 5) and 6) to get 9) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$, 10) $O_{1}=R \cup O_{1}^{\prime}$, 11) $M_{2}=\operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M_{2}^{\prime}$, and 12) $O_{2}=R \cup O_{2}^{\prime}$. We may substitute 3),9) and 11) in 7) to get 13) $M=$ $\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{1}, R\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M^{\prime}$. Using Lemma (7.17) with Rule (20) we get $M=S \operatorname{Cross}_{p}(s, R) \cup M^{\prime}$. Finally we see from 4), 8 ) and 12) we have $O=R \cup O^{\prime}$.

If $s \equiv f_{i}() k$ then by Rule (56) we have 1) $E\left(f_{i}\right)=$ $\left.\left.\left(M_{i}, O_{i}\right), 2\right) p, E, O_{i} \vdash k: M_{k}^{\prime}, O_{k}^{\prime}, 3\right) M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup$ ${\left.\operatorname{symcross}\left(\operatorname{Slabels}_{p}\left(p\left(f_{i}\right)\right), \emptyset\right) \cup M_{i} \cup M_{k}^{\prime}=M_{i} \cup M_{k}^{\prime}, 4\right)}^{\text {, 4 }}$ $\left.\left.O^{\prime}=O_{k}^{\prime}, 5\right) p, E, R \cup O_{i} \vdash k: M_{k}, O_{k}, 6\right) M=\operatorname{Lcross}(l, R) \cup$
 may apply the induction hypothesis with the premise and 2) and 5) to get that there exists $M_{k}^{\prime \prime}, M_{k}^{\prime \prime \prime}, O_{k}^{\prime \prime}$ and $O_{k}^{\prime \prime \prime}$ such that 8) $p, E, \emptyset \vdash$ $\left.k: M_{k}^{\prime \prime}, O_{k}^{\prime \prime}, 9\right) M_{k}^{\prime}=\operatorname{Scross}_{p}\left(k, O_{i}\right) \cup M_{k}^{\prime \prime}$, 10) $O_{k}^{\prime}=O_{i} \cup O_{k}^{\prime \prime}$, 11) $\left.p, E, \emptyset \vdash k: M_{k}^{\prime \prime \prime}, O_{k}^{\prime \prime \prime}, 12\right) M_{k}=\operatorname{Scross}_{p}\left(k, R \cup O_{i}\right) \cup M_{k}^{\prime \prime \prime}$ and 13) $O_{k}=R \cup O_{i} \cup O_{k}^{\prime \prime \prime}$. We apply Lemma (8) with 8) and 11) to get 14) $M_{k}^{\prime \prime}=M_{k}^{\prime \prime \prime}$ and 15) $O_{k}^{\prime \prime}=O_{k}^{\prime \prime \prime}$. We substitute 9) in 3) to get 16) $M^{\prime}=M_{i} \cup \operatorname{Scross}_{p}\left(k, O_{i}\right) \cup M_{k}^{\prime \prime}$. Substituting 12) and 14) and $p\left(f_{i}\right)=s_{i}$ in 6) gives us 17) $M=\operatorname{Lcross}(l, R) \cup$
 Applying the definition of $\operatorname{Scross}_{p}()$ and Lemma (7.5 to 17) gives us 18) $M=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{i}, R\right) \cup \operatorname{Scross}_{p}(k, R) \cup$ $\operatorname{Scross}_{p}\left(k, O_{i}\right) \cup M_{i} \cup M_{k}^{\prime \prime}$. We substitute 16) in 18) to get 19) $M=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{i}, R\right) \cup \operatorname{Scross}_{p}(k, R) \cup M^{\prime}$. Applying Lemma (7.17) with Rule (21) on 19) to get 20) $M=$ $\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$. Substituting 10) and 15) in 13) gives us 21) $O_{k}=R \cup O_{k}^{\prime}$. We substitute 4) and 7) in 21) to get 22) $O=R \cup O^{\prime}$. With 20) and 22) we have our conclusion.
$\Leftrightarrow)$ From Lemma (10) and the premise there exists $M^{\prime \prime}$ and $O^{\prime \prime}$ such that $p, E, R \vdash s: M^{\prime \prime}, O^{\prime \prime}$. If we show $M^{\prime \prime}=M$ and $O^{\prime \prime}=O$ then we will have our conclusion that $p, E, R \vdash s: M, O$. We now will perform induction on $s$ and examine the seven cases and show that $M^{\prime \prime}=M$ and $O^{\prime \prime}=O$.

If $s \equiv s k i p^{l}$ then from Rule (50) we have

1) $\left.\left.M^{\prime}=\operatorname{Lcross}(l, \emptyset)=\emptyset, 2\right) O^{\prime}=\emptyset, 3\right) M^{\prime \prime}=\operatorname{Lcross}(l, R)$ and 4) $O^{\prime \prime}=R$. Substituting 1) and 2) in the premise gives us 5) $M=\operatorname{Scross}_{p}(s, R)$ and 6) $O=R$. Unfolding the definition of $\operatorname{Scross}_{p}()$ in 5) we have 7) $M=\operatorname{symcross}\left(\operatorname{Slabels}_{p}(s), R\right)$. From the definitions $\operatorname{Sabels}_{p}()$ and $\operatorname{Lcross}()$ applied to 7) we get 8) $M=\operatorname{Lcross}(l, R)$. From 3),4),6) and 8) we have $M^{\prime \prime}=M$ and $O^{\prime \prime}=O$.

If $s \equiv s$ kip $^{l} s_{1}$ then from Rule (51) we have 1) $p, E, \emptyset \vdash s_{1}$ : $M_{1}^{\prime}, O_{1}^{\prime}$, 2) $M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup M_{1}^{\prime}=M_{1}^{\prime}$, 3) $O^{\prime}=O_{1}^{\prime}$, 4) $\left.p, E, R \vdash s_{1}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}, 5\right) M^{\prime \prime}=L \operatorname{cross}(l, R) \cup M_{1}^{\prime \prime}$ and 6) $O^{\prime \prime}=O_{1}^{\prime \prime}$. Let 7) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$ and 8) $O_{1}=$ $R \cup O_{1}^{\prime}$. Then using the induction hypothesis we have 9) $p, E, R \vdash$ $s_{1}: M_{1}, O_{1}$. From Lemma (8) on 4) and 9) we have 10) $M_{1}=M_{1}^{\prime \prime}$ and 11) $O_{1}=O_{1}^{\prime \prime}$. Substituting 7) and 10) in 5) and 8) and 11) in 6) yields 12) $M^{\prime \prime}=\operatorname{Lcross}(l, R) \cup S \operatorname{Cross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$ and 13) $O^{\prime \prime}=R \cup O_{1}^{\prime}$. Using Lemma (7.16) with Rule (16) on 12) gives us 14) $M^{\prime \prime}=\operatorname{Scross}_{p}(s, R) \cup M_{1}^{\prime}$. Substituting 2) and 3) in the premise gives us 15) $M=\operatorname{Scross}_{p}(s, R) \cup M_{1}^{\prime}$ and 16) $O=R \cup O_{1}^{\prime}$. From 13),14),15) and 16) we see $M^{\prime \prime}=M$ and $O^{\prime \prime}=O$.

If $s \equiv a[d]={ }^{l} e ; s_{1}$ then we may use similar reasoning as the previous case.

If $s \equiv$ while $(a[d] \neq 0) s_{1} s_{2}$ then from Rule (53) we have 1) $p, E, \emptyset \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 2) $p, E, O_{1}^{\prime} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$, 3) $\left.M^{\prime}=\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup S \operatorname{cross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}, 4\right) O^{\prime}=O_{2}^{\prime}$, 5) $p, E, R \vdash s_{1}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}$, 6) $\left.p, E, O_{1}^{\prime \prime} \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}, 7\right) M^{\prime \prime}=$ $\operatorname{Lcross}\left(l, O_{1}^{\prime \prime}\right) \cup \operatorname{Scross}_{p}\left(s, O_{1}^{\prime \prime}\right) \cup M_{1}^{\prime \prime} \cup M_{2}^{\prime \prime}$ and 8) $O^{\prime \prime}=O_{2}^{\prime \prime}$. Let 9) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}$ and 10) $O_{1}=R \cup O_{1}^{\prime}$. Then from the induction hypothesis we have 11) $p, E, R \vdash s_{1}: M_{1}, O_{1}$. Using Lemma (8) on 5) and 11) results in 12) $M_{1}=M_{1}^{\prime \prime}$ and 13) $O_{1}=O_{1}^{\prime \prime}$. From Lemma (10) there exists $M_{2}$ and $O_{2}$ such that 14) $p, E, \emptyset \vdash s_{2}: M_{2}, O_{2}$. Let 15) $M_{2}^{\prime \prime \prime}=\operatorname{Scross}_{p}\left(s_{2}, O_{1}^{\prime}\right) \cup M_{2}$, 16) $O_{2}^{\prime \prime \prime}=O_{1}^{\prime} \cup O_{2}$, 17) $M_{2}^{\prime \prime \prime \prime}=\operatorname{Sross}_{p}\left(s_{2}, O_{1}^{\prime \prime}\right) \cup M_{2}$ and 18) $O_{2}^{\prime \prime \prime \prime}=O_{1}^{\prime \prime} \cup O_{2}$. We use the induction hypothesis with 14),15) and 16) and 14), 17) and 18) to get 19) $p, E, O_{1}^{\prime} \vdash s_{2}: M_{2}^{\prime \prime \prime}, O_{2}^{\prime \prime \prime}$ and 20) $p, E, O_{1}^{\prime \prime} \vdash s_{2}: M_{2}^{\prime \prime \prime \prime}, O_{2}^{\prime \prime \prime \prime}$. Using Lemma (8) on 2) and 19) and 6) and 20) we get 21) $M_{2}^{\prime}=M_{2}^{\prime \prime \prime}$, 22) $O_{2}^{\prime}=O_{2}^{\prime \prime \prime}$,
23) $M_{2}^{\prime \prime}=M_{2}^{\prime \prime \prime \prime}$ and 24) $O_{2}^{\prime \prime}=O_{2}^{\prime \prime \prime \prime}$. Substituting 15) and 21) in 3) and 16) and 22) in 4) to get 25) $M^{\prime}=\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup$ $\operatorname{Scross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup \operatorname{Scross}_{p}\left(s_{2}, O_{1}^{\prime}\right) \cup M_{2}$ and 26) $O^{\prime}=$ $O_{1}^{\prime} \cup O_{2}$. We apply Lemma (7.17) with Rule (18) on 25) to get 27) $M^{\prime}=\operatorname{Scross}_{p}\left(s, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}$. We now substitute 26) and 27) in the premise and we get 28) $M=\operatorname{Scross}_{p}(s, R) \cup$ $\operatorname{Scross}_{p}\left(s, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}$ and 29) $O=R \cup O_{1}^{\prime} \cup O_{2}$. Applying Lemma (7.5) to 28) results in 30) $M=\operatorname{Scross}_{p}(s, R \cup$ $\left.O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}$. Substituting 9),10), 12),13),17) and 23) in 7) and gives us 31) $M^{\prime \prime}=\operatorname{Lcross}\left(l, R \cup O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime}\right) \cup$ $S \operatorname{cross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime} \cup S \operatorname{cross}_{p}\left(s_{2}, R \cup O_{1}^{\prime}\right) \cup M_{2}$. From substituting 10), 13), 18) and 24) in 8) we get 32) $O^{\prime \prime}=R \cup O_{1}^{\prime} \cup O_{2}$. Using Lemma (7.5) allows us to simplify 31) to 33) $M^{\prime \prime}=\operatorname{Lcross}(l, R \cup$ $\left.O_{1}^{\prime}\right) \cup S \operatorname{cross}_{p}\left(s_{1}, R \cup O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup \operatorname{Scross}_{p}\left(s_{2}, R \cup O_{1}^{\prime}\right) \cup M_{2}$. Next we apply Lemma (7.17) with Rule (18) to get 34) $M^{\prime \prime}=$ $\operatorname{Scross}_{p}\left(s, R \cup O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}$. From 30) and 34) we have $M^{\prime \prime}=M$ and from 29) and 32) we have $O^{\prime \prime}=O$.

If $s \equiv$ async ${ }^{l} s_{1} s_{2}$ then from Rule (54) we have

1) $p, E$, Slabels $\left.s_{p}\left(s_{2}\right) \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}, 2\right) p, E$, Slabel $_{p}\left(s_{1}\right) \vdash$ $s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$, 3) $M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup M_{1}^{\prime} \cup M_{2}^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$, 4) $O^{\prime}=O_{2}^{\prime}$, 5) $p, E$, Slabel $\left.s_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}, 6\right)$ $p, E$, Slabels $\left.s_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}, 7\right) M^{\prime \prime}=\operatorname{Lcross}(l, R) \cup$ $M_{1}^{\prime \prime} \cup M_{2}^{\prime \prime}$ and 8) $O^{\prime \prime}=O_{2}^{\prime \prime}$. From Lemma (10) there exists $M_{1}^{\prime \prime \prime}, M_{2}^{\prime \prime \prime}, O_{1}^{\prime \prime \prime}$, and $O_{2}^{\prime \prime \prime}$ such that 9) $p, E, \emptyset \vdash s_{1}: M_{1}^{\prime \prime \prime}, O_{1}^{\prime \prime \prime}$ and 10) $p, E, \emptyset \vdash s_{2}: M_{2}^{\prime \prime \prime}, O_{2}^{\prime \prime \prime}$.

Let 11) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right)\right) \cup M_{1}^{\prime \prime \prime}$, 12) $O_{1}=$ $\left.\operatorname{Slabels}_{p}\left(s_{2}\right) \cup O_{1}^{\prime \prime \prime}, 13\right) M_{2}=\operatorname{Scross}_{p}\left(s_{2}, \operatorname{Slabels}_{p}\left(s_{1}\right)\right) \cup M_{2}^{\prime \prime \prime}$, 14) $O_{2}=\operatorname{Slabel}_{p}\left(s_{1}\right) \cup O_{2}^{\prime \prime \prime}$,
15) $M_{1}^{\prime \prime \prime \prime}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right) \cup R\right) \cup M_{1}^{\prime \prime \prime}$ 16) $O_{1}^{\prime \prime \prime \prime}=$ Slabels $_{p}\left(s_{2}\right) \cup R \cup O_{1}^{\prime \prime \prime}$, 17) $M_{2}^{\prime \prime \prime \prime}=\operatorname{Scross}_{p}\left(s_{2}\right.$, Slabel $_{p}\left(s_{1}\right) \cup$ $R) \cup M_{2}^{\prime \prime \prime}$ and 18) $O_{2}^{\prime \prime \prime \prime}=\operatorname{Slabels}_{p}\left(s_{1}\right) \cup R \cup O_{2}^{\prime \prime \prime}$. We use the induction hypothesis applied to 9$), 11$ ), and 12); 10),13) and 14); 9),15) and 16); and 10),17) and 18) to get 19) $p, E$, Slabel $_{p}\left(s_{2}\right) \vdash$ $\left.s_{1}: M_{1}, O_{1}, 20\right) p, E$, Slabel $\left._{p}\left(s_{1}\right) \vdash s_{2}: M_{2}, O_{2}, 21\right)$ $p, E$, Slabels $_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}^{\prime \prime \prime}, O_{1}^{\prime \prime \prime \prime}$ and
22) $p, E$, Slabel $_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}^{\prime \prime \prime \prime}, O_{2}^{\prime \prime \prime \prime}$. Using Lemma (8) on 1) and 19); 2) and 20); 5) and 21); and 6) and 22) we have 23) $M_{1}^{\prime}=M_{1}$, 24) $O_{1}^{\prime}=O_{1}$, 25) $M_{2}^{\prime}=M_{2}$, 26) $O_{2}^{\prime}=O_{2}$, 27) $M_{1}^{\prime \prime}=M_{1}^{\prime \prime \prime}$, 28) $\left.O_{1}^{\prime \prime}=O_{1}^{\prime \prime \prime}, 29\right) M_{2}^{\prime \prime}=M_{2}^{\prime \prime \prime \prime}$ and 30) $O_{2}^{\prime \prime}=O_{2}^{\prime \prime \prime}$. We substitute 11),13),23) and 25) in 3) to get 31) $M^{\prime}=\operatorname{Scross}_{p}\left(s_{1}\right.$, Slabels $\left._{p}\left(s_{2}\right)\right) \cup \operatorname{Scross}_{p}\left(s_{2}\right.$, Slabels $\left._{p}\left(s_{1}\right)\right) \cup$ $M_{1}^{\prime \prime \prime} \cup M_{2}^{\prime \prime \prime}$. Substituting 15),17),27) and 29) in 7) gives us 32) $M^{\prime \prime}=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right) \cup R\right) \cup$ $\operatorname{Scross}_{p}\left(s_{2}\right.$, Slabels $\left._{p}\left(s_{1}\right) \cup R\right) \cup M_{1}^{\prime \prime \prime} \cup M_{2}^{\prime \prime \prime}$. We may apply Lemma (7.5) and then substitute 31) in 32) to get 33) $M^{\prime \prime}=$ $\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{1}, R\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M^{\prime}$. Using Lemma (7.17) with Rule (19) on 33) gives us 34) $M^{\prime \prime}=$ $\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$. From 4), 8 ), 14), 18),26) and 30) we may perform substitutions to get 35 ) $O^{\prime \prime}=R \cup O^{\prime}$. By substituting the premise in 34) and 35) we get $M^{\prime \prime}=M$ and $O^{\prime \prime}=O$.

If $s \equiv$ finish $^{l} s_{1} s_{2}$ then by Rule (55) we have 1) $p, E, \emptyset \vdash$ $s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 2) $\left.p, E, \emptyset \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}, 3\right) M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup$ $\left.\left.\left.M_{1}^{\prime} \cup M_{2}^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}, 4\right) O^{\prime}=O_{2}^{\prime}, 5\right) p, E, R \vdash s_{1}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}, 6\right)$ $\left.p, E, R \vdash s_{2}: M_{2}^{\prime \prime}, O_{2}^{\prime \prime}, 7\right) M^{\prime \prime}=\operatorname{Lcross}(l, R) \cup M_{1}^{\prime \prime} \cup M_{2}^{\prime \prime}$ and 8) $O^{\prime \prime}=O_{2}^{\prime \prime}$. Let 9) $\left.M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime}, 10\right)$ $O_{1}=R \cup O_{1}^{\prime}$, 11) $M_{2}=\operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M_{2}^{\prime}$ and 12) $O_{2}=$ $R \cup O_{2}^{\prime}$. From the induction hypothesis applied with 1),9) and 10) and 2),11) and 12) we get 13) $p, E, R \vdash s_{1}: M_{1}, O_{1}$ and 14) $p, E, R \vdash s_{2}: M_{2}, O_{2}$. Using Lemma (8) on 5) and 13) and on 6) and 14) we get 15) $M_{1}=M_{1}^{\prime \prime}$, 16) $M_{2}=M_{2}^{\prime \prime}$ and 17) $O_{2}=O_{2}^{\prime \prime}$. We substitute 9),11),15) and 17) in 7) to get 18) $M^{\prime \prime}=$ $\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{1}, R\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$. Using Lemma (7.17) with Rule (20) on 18) we get 19) $M^{\prime \prime}=$ $\operatorname{Scross}_{p}(s, R) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$. Substituting 4),12) and 17) in 8) gives
us 20) $O^{\prime \prime}=R \cup O^{\prime}$. From the 3),19) and the premise we have $M^{\prime \prime}=M$ and from 20) and the premise we have $O^{\prime \prime}=O$.

If $s \equiv f_{i}()^{l} k$ then by Rule (56) we have 1) $E\left(f_{i}\right)=$ $\left.\left.\left(M_{i}, O_{i}\right), 2\right) p, E, O_{i} \vdash k: M_{k}^{\prime}, O_{k}^{\prime}, 3\right) M^{\prime}=\operatorname{Lcross}(l, \emptyset) \cup$ ${\left.\operatorname{symcross}\left(\operatorname{Slabels}_{p}\left(p\left(f_{i}\right)\right), \emptyset\right) \cup M_{i} \cup M_{k}^{\prime}=M_{i} \cup M_{k}^{\prime}, 4\right) O^{\prime}=}^{\prime}=$ $\left.\left.O_{k}^{\prime}, 5\right) p, E, R \cup O_{i} \vdash k: M_{k}^{\prime \prime}, O_{k}^{\prime \prime}, 6\right) M^{\prime \prime}=\operatorname{Lcross}(l, R) \cup$
 Applying Lemma (10) with 2) we have that there exists $M_{k}^{\prime \prime \prime}$ and $O_{k}^{\prime \prime \prime}$ such that 8) $p, E, \emptyset \vdash k: M_{k}^{\prime \prime \prime}, O_{k}^{\prime \prime \prime}$. Let 9) $M_{k}^{\prime \prime \prime \prime}=$ $\operatorname{Scross}_{p}\left(k, O_{i}\right) \cup M_{k}^{\prime \prime \prime}$, 10) $O_{k}^{\prime \prime \prime \prime}=O_{i} \cup O_{k}^{\prime \prime \prime}$, 11) $M_{k}^{\prime \prime \prime \prime \prime}=$ $\operatorname{Scross}_{p}\left(k, R \cup O_{i}\right) \cup M_{k}^{\prime \prime \prime}$ and 12) $O_{k}^{\prime \prime \prime \prime \prime}=R \cup O_{i} \cup O_{k}^{\prime \prime \prime}$. We may apply the induction hypothesis with the premise, 8),9) and 10) to get 13) $p, E, O_{i} \vdash k: M_{k}^{\prime \prime \prime \prime}, O_{k}^{\prime \prime \prime \prime}$. We also use the induction hypothesis with the premise, 8),11) and 12) to get 14) $p, E, R \cup O_{i} \vdash$ $k: M_{k}^{\prime \prime \prime \prime \prime}, O_{k}^{\prime \prime \prime \prime \prime}$. Using Lemma (8) with 2) and 13) and with 5) and 14) gives us 15) $M_{k}^{\prime}=M_{k}^{\prime \prime \prime \prime}$, 16) $O_{k}^{\prime}=O_{k}^{\prime \prime \prime \prime}$, 17) $M_{k}^{\prime \prime}=M_{k}^{\prime \prime \prime \prime \prime}$ and 18) $O_{k}^{\prime \prime}=O_{k}^{\prime \prime \prime \prime \prime}$. We apply Lemma (7.5) on 11) to get 19) $M_{k}^{\prime \prime \prime \prime \prime}=\operatorname{Scross}_{p}(k, R) \cup \operatorname{Scross}_{p}\left(k, O_{i}\right) \cup M_{k}^{\prime \prime \prime}$. Substituting 9),15) and 17) in 19) gives us 20) $M_{k}^{\prime \prime}=\operatorname{Scross}_{p}(k, R) \cup M_{k}^{\prime}$. Substituting 10),16) and 18) in 12) gives us 21) $O_{k}^{\prime \prime}=R \cup O_{k}^{\prime}$. We substitute 20) in 6) then apply the definition of $\operatorname{Scross}_{p}()$ with $p\left(f_{i}\right)=s_{i}$ to get 22) $M^{\prime \prime}=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{i}, R\right) \cup$ $\operatorname{Scross}_{p}(k, R) \cup M_{i} \cup M_{k}^{\prime}$. Applying Lemma (7.17) with Rule (21) to 22) gives us 23) $M^{\prime \prime}=\operatorname{Scross}_{p}(s, R) \cup M_{i} \cup M_{k}^{\prime}$. We may substitute 3) in 24) to get 24) $M^{\prime \prime}=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$. Substituting 4) and 7) in 22) gives us 25) $O^{\prime \prime}=R \cup O^{\prime}$. Substituting the premise in 24) and 25) gives us $M^{\prime \prime}=M$ and $O^{\prime \prime}=O$ as desired.

Likewise, we need a version that applies to an execution tree.
Lemma 13. $p, E, R \vdash T: M$ if and only if there exists $M^{\prime}$ such that $p, E, \emptyset \vdash T: M^{\prime}$ and $M=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$.

Proof. $\Rightarrow$ ) From Lemma (11) there exists $M^{\prime}$ such that $p, E, \emptyset \vdash$ $T: M^{\prime}$. We perform induction on $T$ and in each of the four cases we will show $M=\operatorname{Tross}_{p}(T, R) \cup M^{\prime}$.

If $T \equiv \sqrt{ }$ then from Rule (49) we have 1) $M=\emptyset$ and 2) $M^{\prime}=\emptyset$. From Lemma (7.9) we have 3) $\operatorname{Tcross}_{p}(\sqrt{ }, R)=\emptyset$. From 1), 2) and 3) we can see that $M=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$.

If $T \equiv T_{1} \triangleright T_{2}$ then by Rule (46) we have 1) $p, E, R \vdash T_{1}$ : $M_{1}$, 2) $\left.\left.p, E, R \vdash T_{2}: M_{2}, 3\right) M=M_{1} \cup M_{2}, 4\right) p, E, \emptyset \vdash T_{1}$ : $M_{1}^{\prime}$, 5) $p, E, \emptyset \vdash T_{2}: M_{2}^{\prime}$ and 6) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. We may use the induction hypothesis on 1) and 2) to get 7) $p, E, \emptyset \vdash T_{1}: M_{1}^{\prime \prime}$, 8) $M_{1}=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup M_{1}^{\prime \prime}$, 9) $p, E, \emptyset \vdash T_{2}: M_{2}^{\prime \prime}$ and 10) $M_{2}=\operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup M_{2}^{\prime \prime}$. From Lemma (9) we have that 11) $M_{1}^{\prime}=M_{1}^{\prime \prime}$ and 12) $M_{2}^{\prime}=M_{2}^{\prime \prime}$. Let us substitute 8), 10),11) and 12) in 3) to get 13) $M=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup \operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup$ $M_{1}^{\prime} \cup M_{2}^{\prime}$. From Rule (23) we may apply Lemma (7.19) on 13) to get 14) $M=\operatorname{Tcross}_{p}(T, R) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$. Finally substituting 6) in 14) we get $M=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$.

If $T \equiv T_{1} \| T_{2}$ then by Rule (47) we have

1) $p, E$, Tlabels $\left._{p}\left(T_{2}\right) \cup R \vdash T_{1}: M_{1}, 2\right) p, E$, Tlabels $_{p}\left(T_{1}\right) \cup$ $\left.R \vdash T_{2}: M_{2}, 3\right) M=M_{1} \cup M_{2}$, 4) $p, E$, Tlabel $_{p}\left(T_{2}\right) \vdash T_{1}$ : $M_{1}^{\prime}$, 5) $p, E$, Tlabels $s_{p}\left(T_{1}\right) \vdash T_{2}: M_{2}^{\prime}$ and 6) $M^{\prime} \stackrel{M}{=} M_{1}^{\prime} \cup M_{2}^{\prime}$. From the induction hypothesis applied to 1,2$), 4$ ) and 5 ) we get 7) $\left.p, E, \emptyset \vdash T_{1}: M_{1}^{\prime \prime}, 8\right) M_{1}=\operatorname{Tcross}_{p}\left(T_{1}\right.$, Tlabels $\left._{p}\left(T_{2}\right) \cup R\right) \cup$ $\left.M_{1}^{\prime \prime}, 9\right) p, E, \emptyset \vdash T_{2}: M_{2}^{\prime \prime}$,
2) $\left.M_{2}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right) \cup R\right) \cup M_{2}^{\prime \prime}$, 11) $p, E, \emptyset \vdash$ $\left.\left.T_{1}: M_{1}^{\prime \prime \prime} 12\right) M_{1}^{\prime}=\operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup M_{1}^{\prime \prime \prime}, 13\right)$ $p, E, \emptyset \vdash T_{2}: M_{2}^{\prime \prime \prime}$ and 14) $M_{2}^{\prime}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabel}_{p}\left(T_{1}\right)\right) \cup$ $M_{2}^{\prime \prime \prime}$, From Lemma (9) applied to 7) and 11) and to 9) and 13) we get 15) $M_{1}^{\prime \prime}=M_{1}^{\prime \prime \prime}$ and 16) $M_{2}^{\prime \prime}=M_{2}^{\prime \prime \prime}$. We use Lemma (7.7) on 8) and 10) to get 17) $M_{1}=\operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup$ $\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup M_{1}^{\prime \prime}$ and
3) $M_{2}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right) \cup \operatorname{Tross}_{p}\left(T_{2}, R\right) \cup M_{2}^{\prime \prime}$.

We substitute 12) and 15) in 17) and substitute 14) and 16) in 18) to get 19) $M_{1}=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup M_{1}^{\prime}$ and 20) $M_{2}=$ $\operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup M_{2}^{\prime}$. Substituting 6),21) and 22) in 3) yields 21) $M=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup \operatorname{Tross}_{p}\left(T_{2}, R\right) \cup M^{\prime}$. Finally we use Lemma (7.19) with Rule (24) on 21) to get our conclusion $M=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$.

If $T \equiv\langle s\rangle$ then from Rule (48) we have 1) $p, E, R \vdash s$ : $\left.M_{s}, O_{s}, 2\right) M=M_{s}$, 3) $p, E, \emptyset \vdash s: M_{s}^{\prime}, O_{s}^{\prime}$ and 4) $M^{\prime}=M_{s}^{\prime}$. Using Lemma (12) with the premise on 1) we get 5) $p, E, \emptyset \vdash s$ : $M_{s}^{\prime \prime}, O_{s}^{\prime \prime}$ and 6) $M_{s}=\operatorname{Scross}_{p}(s, R) \cup M_{s}^{\prime \prime}$. From Lemma (9) we have that 7) $M_{s}^{\prime}=M_{s}^{\prime \prime}$. Using Lemma (7.18) on 6) we get 9) $M_{s}=\operatorname{Tcross}_{p}(T, R) \cup M_{s}^{\prime \prime}$. We substitute 4),7) and 8) in 2) and we get $M=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$.
$\Leftarrow)$ From Lemma (11) there exists $M^{\prime \prime}$ such that $p, E, R \vdash T$ : $M^{\prime \prime}$. We also have $\vdash p: E$ from the premise. Using induction on $T$ we will examine the four cases and show that $M^{\prime \prime}=M$ which will give us our conclusion that $p, E, R \vdash T: M$.

If $T \equiv \sqrt{ }$ then from Rule (49) we have 1) $M^{\prime \prime}=\emptyset$ and 2) $M^{\prime}=\emptyset$. From Lemma (7.9) we have 3) $\operatorname{Tcross}_{p}(\sqrt{ }, R)=\emptyset$. Let us substitute 2) and 3) in the premise to get 4) $M=\emptyset$. From 1) and 4) we see $M^{\prime \prime}=M$.

If $T \equiv T_{1} \triangleright T_{2}$ then from Rule (46) we have 1) $p, E, R \vdash T_{1}$ : $M_{1}^{\prime \prime}$, 2) $p, E, R \vdash T_{2}: M_{2}^{\prime \prime}$, 3) $M^{\prime \prime}=M_{1}^{\prime \prime} \cup M_{2}^{\prime \prime}$, 4) $p, E, \emptyset \vdash T_{1}$ : $M_{1}^{\prime}$, 5) $p, E, \emptyset \vdash T_{2}: M_{2}^{\prime}$ and 6) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. Let 7) $M_{1}^{\prime \prime \prime}=$ $\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup M_{1}^{\prime}$ and 8) $M_{2}^{\prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup M_{2}^{\prime}$. Using the induction hypothesis with 4) and 7) and with 5) and 8) we obtain 9) $p, E, R \vdash T_{1}: M_{1}^{\prime \prime \prime}$ and 10) $p, E, R \vdash T_{2}: M_{2}^{\prime \prime \prime}$. Using Lemma (9) on 1) and 9) and on 2) and 10) we get 11) $M_{1}^{\prime \prime}=M_{1}^{\prime \prime \prime}$ and 12) $M_{2}^{\prime \prime}=M_{2}^{\prime \prime \prime}$. Substituting 6),7),8), 11) and 12) in 3) gives us 13) $M^{\prime \prime}=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup \operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup M^{\prime}$. We may use Lemma (7.19) with Rule (23) on 13) to get 14) $M^{\prime \prime}=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$. Comparing 14) to the premise gives us $M^{\prime \prime}=M$.

If $T \equiv T_{1} \| T_{2}$ then from Rule (47) we have

1) $p, E$, Tlabel $\left._{p}\left(T_{2}\right) \cup R \vdash T_{1}: M_{1}^{\prime \prime}, 2\right) p, E$, Tlabels ${ }_{p}\left(T_{1}\right) \cup$ $R \vdash T_{2}: M_{2}^{\prime \prime}$, 3) $M^{\prime \prime}=M_{1}^{\prime \prime} \cup M_{2}^{\prime \prime}$, 4) $p, E$, Tlabel $_{p}\left(T_{2}\right) \vdash$ $\left.T_{1}: M_{1}^{\prime}, 5\right) p, E$, Tlabel $_{p}\left(T_{1}\right) \vdash T_{2}: M_{2}^{\prime}$ and 6 ) $M^{\prime}=$ $M_{1}^{\prime} \cup M_{2}^{\prime}$, From Lemma (11) there exist $M_{1}$ and $M_{2}$ such that 7) $p, E, \emptyset \vdash T_{1}: M_{1}$ and 8) $p, E, \emptyset \vdash T_{2}: M_{2}$. Let 9) $M_{1}^{\prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{1}\right.$, Tlabels $\left._{p}\left(T_{2}\right) \cup R\right) \cup M_{1}$,
2) $M_{2}^{\prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right) \cup R\right) \cup M_{2}$, 11) $M_{1}^{\prime \prime \prime \prime}=$ $\operatorname{Tcross}_{p}\left(T_{1}\right.$, Tlabels $\left._{p}\left(T_{2}\right)\right) \cup M_{1}$ and
3) $M_{2}^{\prime \prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right) \cup M_{2}$.

Applying Lemma (7.7) on 9) and 10) which gives us 13) $M_{1}^{\prime \prime \prime}=$ $\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup \operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup M_{1}$ and 14) $M_{2}^{\prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup \operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right) \cup M_{2}$. Substituting 11) and 12) in 13) and 14), respectively, yields 15) $M_{1}^{\prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{1}, R\right) \cup M_{1}^{\prime \prime \prime \prime}$ and 16) $M_{2}^{\prime \prime \prime}=\operatorname{Tcross}_{p}\left(T_{2}, R\right) \cup$ $M_{2}^{\prime \prime \prime \prime}$. Applying the induction hypothesis to 7) and 9); 8) and 10); 7) and 11); and 8) and 12) to get 17) $p, E$, Tlabels $_{p}\left(T_{2}\right) \cup R \vdash$ $T_{1}: M_{1}^{\prime \prime \prime}$, 18) $p, E$, Tlabels $\left.s_{p}\left(T_{1}\right) \cup R \vdash T_{2}: M_{2}^{\prime \prime \prime}, 19\right)$ $p, E$, Tlabels $_{p}\left(T_{2}\right) \vdash T_{1}: M_{1}^{\prime_{1 \prime \prime}^{\prime \prime \prime}}$ and 20) $p, E$, Tlabel $_{p}\left(T_{1}\right) \vdash$ $T_{2}: M_{2}^{\prime \prime \prime \prime}$. From Lemma (9) applied to 1 ) and 17); 2) and 18); 4) and 19); and 5) and 20) which gives us 21) $M_{1}^{\prime \prime}=M_{1}^{\prime \prime \prime}$, 22) $M_{2}^{\prime \prime}=M_{2}^{\prime \prime \prime}$, 23) $M_{1}^{\prime}=M_{1}^{\prime \prime \prime \prime}$ and 24) $M_{2}^{\prime}=M_{2}^{\prime \prime \prime \prime}$. Substituting 6),15),16),21),22),23) and 24) in 3) yields 26) $M^{\prime \prime}=$ $\operatorname{Trross}_{p}\left(T_{1}, R\right) \cup \operatorname{Tross}_{p}\left(T_{2}, R\right) \cup M^{\prime}$. We use Lemma (7.19) with Rule (24) to get 27) $M^{\prime \prime}=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$. With 27) and the premise we see that $M^{\prime \prime}=M$.

If $T \equiv\langle s\rangle$ then from Rule (48) we have 1) $p, E, R \vdash s$ : $M_{s}^{\prime \prime}, O_{s}^{\prime \prime}$, 2) $M^{\prime \prime}=M_{s}^{\prime \prime}$, 3) $p, E, \emptyset \vdash s: M_{s}^{\prime}, O_{s}^{\prime}$ and 4) $M^{\prime}=$ $M_{s}^{\prime}$. Using Lemma (12) with the premise on 1) we get 5) $p, E, \emptyset \vdash$ $\left.s: M_{s}^{\prime \prime \prime}, O_{s}^{\prime \prime \prime} 6\right) M_{s}^{\prime \prime}=\operatorname{Scross} s_{p}(s, R) \cup M_{s}^{\prime \prime \prime}$. From Lemma (8) applied to 3) and 5) we get 7) $M_{s}^{\prime}=M_{s}^{\prime \prime \prime}$. We now will substitute 4),6) and 7) in 2) to get 8) $M^{\prime \prime}=\operatorname{Scross}_{p}(s, R) \cup M^{\prime}$. Applying

Lemma (7.18) and on 8) we get 9) $M^{\prime \prime}=\operatorname{Tcross}_{p}(T, R) \cup M^{\prime}$. Upon comparing the premise with 9) we see that $M^{\prime \prime}=M$.

### 8.4 Preservation

In Rules (11) and (14) we use the . operator to combine statements so we need a way to type check such combined statements. The following lemma shows that a natural type rule for $s_{a} . s_{b}$ is admissible.

Lemma 14. If $p, E, R \vdash s_{a}: M_{a}, O_{a}$ and $p, E, O_{a} \vdash s_{b}:$ $M_{b}, O_{b}$ and $p, E, R \vdash s_{a} \cdot s_{b}: M, O$ then $M=M_{a} \cup M_{b}$ and $O=O_{b}$.
Proof. Let $s=s_{a} \cdot s_{b}$. We will perform induction on $s_{a}$. This gives us seven cases.

If $s_{a} \equiv s k i p^{l}$ then by the definition of . we have 1) $s=$ skip ${ }^{l} s_{b}$. From Rule (51) we have 2) $\left.p, E, R \vdash s_{b}: M_{b}^{\prime}, O_{b}^{\prime}, 3\right)$ $M=\operatorname{Lcross}(l, R) \cup M_{b}^{\prime}$ and 4) $O=O_{b}^{\prime}$. From Rule (50) we have 5) $M_{a}=\operatorname{Lcross}(l, R)$ and 6) $O_{a}=R$. Substituting 6) in the premise gives us 7) $p, E, R \vdash s_{b}: M_{b}, O_{b}$. From Lemma (8) applied to 2) and 7) we get 8) $M_{b}=M_{b}^{\prime}$ and 9) $O_{b}=O_{b}^{\prime}$. Using substitution of 5) and 8) in 3) and 9) in 4) we have $M=M_{a} \cup M_{b}$ and $O=O_{b}$.

If $s_{a} \equiv$ skip ${ }^{l} s_{1}$ then by Rule (50) and the definition of . we have 1) $s=\operatorname{skip}^{l}\left(s_{1} \cdot s_{b}\right)$. From Rule (51) we have 2) $p, E, R \vdash$ $\left.\left.\left(s_{1} \cdot s_{b}\right): M_{k}, O_{k}, 3\right) M=\operatorname{Lcross}(l, R) \cup M_{k}, 4\right) O=O_{k}$, 5) $\left.p, E, R \vdash s_{1}: M_{1}, O_{1}, 6\right) M_{a}=\operatorname{Lcross}(l, R) \cup M_{1}$ and 7) $O_{a}=O_{1}$. After substituting 7) in 5), we may use the induction hypothesis to get 8) $M_{k}=M_{1} \cup M_{b}$ and 9) $O_{k}=O_{b}$. From 3),4),6) and 9) we arrive at our conclusion that $M=M_{a} \cup M_{b}$ and $O=O_{b}$.

If $s_{a} \equiv a[d]={ }^{l} e ; s_{1}$ then we proceed using similar reasoning as with the previous case.

If $s_{a} \equiv$ while $(a[d] \neq 0) s_{1} s_{2}$ then from the definition of . we have 1) $s=$ while $^{l}(a[d] \neq 0) s_{1}\left(s_{2} \cdot s_{b}\right)$. From Rule (53) we have 2) $\left.p, E, R \vdash s_{1}: M_{1}, O_{1}, 3\right) p, E, O_{1} \vdash\left(s_{2} \cdot s_{b}\right): M_{k}, O_{k}$, 4) $M=\operatorname{Lcross}\left(l, O_{1}\right) \cup \operatorname{Crross}_{p}\left(s_{1}, O_{1}\right) \cup M_{1} \cup M_{k}$, 5) $O=O_{k}$, 6) $p, E, R \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 7) $\left.p, E, O_{1}^{\prime} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}, 8\right) M_{a}=$ $\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$ and 9) $O_{a}=O_{2}^{\prime}$. From Lemma (8) applied to 2) and 6) we have that 10) $M_{1}=M_{1}^{\prime}$ and 11) $O_{1}=O_{1}^{\prime}$. Substituting 9) and 11) in 7) allows us to use the induction hypothesis to get 12) $M_{k}=M_{2}^{\prime} \cup M_{b}$ and 13) $O_{k}=O_{b}$. From 4),5),8),12) and 13) we see that $M=M_{a} \cup M_{b}$ and $O=O_{b}$.

If $s_{a} \equiv$ async ${ }^{l} s_{1} s_{2}$ then from the definition of . we have 1) $s=$ async $^{l} s_{1}\left(s_{2} \cdot s_{b}\right)$. From Rule (54) we have 2) $p, E$, Slabel $\left.s_{p}\left(s_{2} \cdot s_{b}\right) \cup R \vdash s_{1}: M_{1}, O_{1}, 3\right) p, E$, Slabel $_{p}\left(s_{1}\right) \cup$ $\left.R \vdash\left(s_{2} \cdot s_{b}\right): M_{k}, O_{k}, 4\right) M=\operatorname{Lcross}(l, R) \cup M_{1} \cup M_{k}$, 5) $O=O_{k}$, 6) $p, E$, Slabel $\left.s_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}, 7\right)$ $p, E$, Slabels $\left.s_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}, 8\right) M_{a}=\operatorname{Lcross}(l, R) \cup$ $M_{1}^{\prime} \cup M_{2}^{\prime}$ and 9) $O_{a}=O_{2}^{\prime}$. By substituting 9) in 7) we are able to apply the induction hypothesis and get 10) $M_{k}=M_{2}^{\prime} \cup M_{b}$ and 11) $O_{k}=O_{b}$. Applying Lemma (12) to 2),6),7) and the $p, E, O_{a} \vdash$ $s_{b}: M_{b}, O_{b}$ from the premise gives us 12) $p, E, \emptyset \vdash s_{1}: M_{w}, O_{w}$ 13) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2} \cdot s_{b}\right) \cup R\right) \cup M_{w}$, 14) $p, E, \emptyset \vdash$ $\left.s_{1}: M_{x}, O_{x}, 15\right) M_{1}^{\prime}=\operatorname{Scross}_{p}\left(s_{1}\right.$, Slabels $\left._{p}\left(s_{2}\right) \cup R\right) \cup M_{x}$, 16) $p, E, \emptyset \vdash s_{2}: M_{y}, O_{y}$, 17) $O_{2}^{\prime}=$ Slabel $_{p}\left(s_{1}\right) \cup R \cup O_{y}$, 18) $p, E, \emptyset \vdash s_{b}: M_{z}, O_{z}$ and 19) $M_{b}=\operatorname{Scross}_{p}\left(s_{b}, O_{a}\right) \cup M_{z}$. From Lemma (8) applied to 12) and 14) we get 20) $M_{w}=$ $M_{x}$. We may substitute 9) and 17) in 19) to get 21) $M_{b}=$ $\operatorname{Scross}_{p}\left(s_{b}\right.$, Slabels $\left._{p}\left(s_{1}\right) \cup R \cup O_{y}\right) \cup M_{z}$. Using Lemma (7.11) on 13) we get
22) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{2}\right) \cup\right.$ Slabel $\left._{p}\left(s_{b}\right) \cup R\right) \cup$ $M_{w}$. Applying Lemma (7.5) to 21) and 22) yields 23) $M_{b}=$ $\operatorname{Scross}_{p}\left(s_{b}, \operatorname{Slabels}_{p}\left(s_{1}\right)\right) \cup \operatorname{Scross}_{p}\left(s_{b}, R \cup O_{y}\right) \cup M_{z}$ and 24) $M_{1}=\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{b}\right)\right) \cup \operatorname{Sross}_{p}\left(s_{1}\right.$, Slabels $_{p}\left(s_{2}\right) \cup$ $R) \cup M_{w}$. Using Lemma (7.6) we have
25) $\operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabels}_{p}\left(s_{b}\right)\right)=\operatorname{Scross}_{p}\left(s_{b}, \operatorname{Slabels}_{p}\left(s_{1}\right)\right)$. From 23) and 25) we see that 26) $\operatorname{Scross}_{p}\left(s_{b}\right.$, Slabel $\left._{p}\left(s_{1}\right)\right) \subseteq$ $M_{b}$. We now substitute 15) and 20) in 24) to get 27) $M_{1}=$ $\operatorname{Scross}_{p}\left(s_{1}\right.$, Slabels $\left._{p}\left(s_{b}\right)\right) \cup M_{1}^{\prime}$. Substituting 10) and 27) in 4) gives us 28) $M=\operatorname{Lcross}(l, R) \cup \operatorname{Scross}_{p}\left(s_{1}, \operatorname{Slabel}_{p}\left(s_{b}\right)\right) \cup$ $M_{1}^{\prime} \cup M_{2}^{\prime} \cup M_{b}$. From 27) we may simplify 28) to 29) $M=$ $\operatorname{Lcross}(l, R) \cup M_{1}^{\prime} \cup M_{2}^{\prime} \cup M_{b}$. Finally substituting 8) in 29) gives us $M=M_{a} \cup M_{b}$ and then substituting 5) in 11) gives us $O=O_{b}$.

If $s_{a} \equiv$ finish ${ }^{l} s_{1} s_{2}$ then from the definition of . we obtain 1) $s=$ finish $^{l} s_{1}\left(s_{2} \cdot s_{b}\right)$. From Rule (55) we have 2) $p, E, R \vdash$ $\left.\left.s_{1}: M_{1}, O_{1}, 3\right) p, E, R \vdash\left(s_{2} \cdot s_{b}\right): M_{k}, O_{k}, 4\right) M=$ $\operatorname{Lcross}(l, R) \cup M_{1} \cup M_{k}$, 5) $\left.O=O_{k}, 6\right) p, E, R \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 7) $\left.p, E, R \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}, 8\right) M_{a}=\operatorname{Lcross}(l, R) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$ and 9) $O_{a}=O_{2}^{\prime}$. From Lemma (8) applied to 2) and 6) we have 10) $M_{1}=M_{1}^{\prime}$. By substituting 9) in 7) we may apply the induction hypothesis to get 11) $M_{k}=M_{2}^{\prime} \cup M_{b}$ and 12) $O_{k}=O_{b}$. From 4),5),8),10), 11) and 12) we have $M=M_{a} \cup M_{b}$ and $O=O_{b}$.

If $s_{a} \equiv f_{i}()^{l} k$ then from the definition of . we get 1) $s=f_{i}()^{l}\left(k . s_{b}\right)$. From Rule (56) we have 2) $E\left(f_{i}\right)=$ $\left(M_{i}, O_{i}\right)$, 3) $\left.p, E, R \cup O_{i} \vdash\left(k . s_{b}\right): M_{k}^{\prime}, O_{k}^{\prime}, 4\right) M=$ $\operatorname{Lcross}(l, R) \cup \operatorname{symcross}\left(\operatorname{Slabels}_{p}\left(p\left(f_{i}\right)\right), R\right) \cup M_{i} \cup M_{k}^{\prime}$, 5) $O=O_{k}^{\prime}$, 6) $\left.p, E, R \cup O_{i} \vdash k: M_{k}, O_{k}, 7\right) M_{a}=$ $\operatorname{Lcross}(l, R) \cup \operatorname{symcross}\left(\operatorname{Slabel}_{p}\left(p\left(f_{i}\right)\right), R\right) \cup M_{i} \cup M_{k}$ and 8) $O_{a}=O_{k}$. Applying the induction hypothesis with the premise, 3) and 6) gives us 9) $M_{k}^{\prime}=M_{k} \cup M_{b}$ and 10) $O_{k}^{\prime}=O_{b}$. From 4),5),7),8),9) and 10) we have $M=M_{a} \cup M_{b}$ and $O=O_{b}$.

When we step by Rule (3) and (4) in the proof of Preservation, we will need this helper lemma.

Lemma 15. If $p, E, R \vdash T: M$ and $p, E, R^{\prime} \vdash T: M^{\prime}$ and $R^{\prime} \subseteq R$ then $M^{\prime} \subseteq M$.

Proof. Using Lemma (13) on the premise we have 1) $p, E, \emptyset \vdash T$ : $M_{0}$, 2) $M=\operatorname{Tcross}_{p}(T, R) \cup M_{0}$, 3) $p, E, \emptyset \vdash T: M_{0}^{\prime}$ and 4) $M^{\prime}=\operatorname{Tcross}_{p}\left(T, R^{\prime}\right) \cup M_{0}^{\prime}$. Applying Lemma (9) to 1) and 3) gives us 5) $M_{0}=M_{0}^{\prime}$. We use Lemma (7.10) with the premise to get 6) $\operatorname{Tcross}_{p}\left(T, R^{\prime}\right) \subseteq \operatorname{Tcross}_{p}(T, R)$. From 2),4),5) and 6) it is easy to see that $M^{\prime} \subseteq M$.

We are now ready to prove preservation.
Lemma 16. If $\vdash p: E$ and $p, E, \emptyset \vdash T: M$ and $(p, A, T) \rightarrow$ $\left(p, A^{\prime}, T^{\prime}\right)$, then there exists $M^{\prime}$ such that $p, E, \emptyset \vdash T^{\prime}: M^{\prime}$ and $M^{\prime} \subseteq M$.
Proof. From Lemma (13) there exists $M^{\prime}$ such that 0$) p, E, \emptyset \vdash$ $T^{\prime}: M^{\prime}$. We will now show $M^{\prime} \subseteq M$. We perform induction on $T$ and examine the four cases.

If $T \equiv \sqrt{ }$ then $T$ does not take a step.
If $T \equiv T_{1} \triangleright T_{2}$ then there are two rules by which we may take a step.

Suppose we step by Rule (1) we have that 1) $T^{\prime}=T_{2}$. We may substitute 1) in 0) to get 2) $p, E, \emptyset \vdash T_{2}: M^{\prime}$ From Rule (46) we have 3) $p, E, \emptyset \vdash T_{1}: M_{1}$, 4) $p, E, \emptyset \vdash T_{2}: M_{2}$ and 5) $M=M_{1} \cup M_{2}$. From Lemma (9) applied to 2) and 4) we have that 6) $M^{\prime}=M_{2}$. We see the that $M^{\prime} \subseteq M$ from 5) and 6).

Suppose we step by Rule (2) we have 1) $T^{\prime}=T_{1}^{\prime} \triangleright T_{2}$ and 2) $\left(p, A, T_{1}\right) \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)$. Substituting 1) in 0) gives us 3) $p, E, \emptyset \vdash$ $T_{1}^{\prime} \triangleright T_{2}: M^{\prime}$. From Rule (46) we have 4) $\left.p, E, \emptyset \vdash T_{1}: M_{1}, 5\right)$ $\left.\left.p, E, \emptyset \vdash T_{2}: M_{2}, 6\right) M=M_{1} \cup M_{2}, 7\right) p, E, \emptyset \vdash T_{1}^{\prime}: M_{1}^{\prime}$, 8) $p, E, \emptyset \vdash T_{2}: M_{2}^{\prime}$ and 9) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. From Lemma (9) applied to 5) and 8) we have 10) $M_{2}=M_{2}^{\prime}$. We may apply the induction hypothesis with 4) and 2) and get that there exists $M_{1}^{\prime \prime}$ such that 11) $p, E, \emptyset \vdash T_{1}^{\prime}: M_{1}^{\prime \prime}$ and 12) $M_{1}^{\prime \prime} \subseteq M_{1}$. Using Lemma (9) on 7) and 11) we get 13) $M_{1}^{\prime}=M_{1}^{\prime \prime}$. From 6),9), 10), 12) and 13) we see that $M^{\prime} \subseteq M$.

If $T \equiv T_{1} \| T_{2}$ then there are four rules by which we may take a step.

Suppose we step by Rule (3) we then have 1) $T^{\prime}=T_{2}$. We may substitute 1) in 0) to get 2) $p, E, \emptyset \vdash T_{2}: M^{\prime}$. From Rule (47) we have 3) $p, E$, Tlabel $\left._{p}\left(T_{2}\right) \vdash T_{1}: M_{1}, 4\right) p, E$, Tlabels $_{p}\left(T_{1}\right) \vdash$ $T_{2}: M_{2}$ and 5) $M=M_{1} \cup M_{2}$. We can immediately see that 6) $\emptyset \subseteq \operatorname{Tlabels}\left(T_{1}\right)$. We also apply Lemma (15) on 2$), 4$ ) and 6) to get 7) $M^{\prime} \subseteq M_{2}$. We may see from 5) and 7) that $M^{\prime} \subseteq M$.

Suppose we step by Rule (4) then we proceed using similar reasoning as the previous case.

Suppose we step by Rule (5) then we have 1) $T^{\prime}=T_{1}^{\prime} \| T_{2}$ and 2) $\left(p, A, T_{1}\right) \rightarrow\left(p, A^{\prime}, T_{1}^{\prime}\right)$. Substituting 1) in 0) yields 3) $p, E, \emptyset \vdash T_{1}^{\prime} \| T_{2}: M^{\prime}$. From Rule (47) we have 4) $p, E$, llabels $_{p}\left(T_{2}\right) \vdash T_{1}: M_{1}$, 5) $p, E$, Tlabels $_{p}\left(T_{1}\right) \vdash T_{2}:$ $M_{2}$, 6) $\left.M=M_{1} \cup M_{2}, 7\right) p, E$, Tlabels $\left._{p}\left(T_{2}\right) \vdash T_{1}^{\prime}: M_{1}^{\prime}, 8\right)$ $p, E$, Tlabels $_{p}\left(T_{1}^{\prime}\right) \vdash T_{2}: M_{2}^{\prime}$ and 9) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. Using Lemma (13) on 4),5),6) and 7) gives us 10) $\left.p, E, \emptyset \vdash T_{1}: M_{1}^{\prime \prime}, 11\right)$ $\left.M_{1}=\operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup M_{1}^{\prime \prime}, 12\right) p, E, \emptyset \vdash T_{2}: M_{2}^{\prime \prime}$, 13) $M_{2}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right) \cup M_{2}^{\prime \prime}$, 14) $p, E$, $\emptyset \vdash T_{1}^{\prime}$ : $\left.\left.M_{1}^{\prime \prime \prime}, 15\right) M_{1}^{\prime}=\operatorname{Tcross}_{p}\left(T_{1}^{\prime}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup M_{1}^{\prime \prime \prime}, 16\right) p, E, \emptyset \vdash$ $T_{2}: M_{2}^{\prime \prime \prime}$ and 17) $M_{2}^{\prime}=\operatorname{Tcross}_{p}\left(T_{2}\right.$, Tlabels $\left._{p}\left(T_{1}^{\prime}\right)\right) \cup M_{2}^{\prime \prime \prime}$. From using the induction hypothesis applied to 2),10) and 14) and using Lemma (9) we get 18) $M_{1}^{\prime \prime \prime} \subseteq M_{1}^{\prime \prime}$. We use Lemma (9) on 12) and 16) to get 19) $M_{2}^{\prime \prime}=M_{2}^{\prime \prime \prime}$. Using Lemma (7.8) and substituting 11),13),15),17) and 19) in 6) and 9) results in 20) $M=\operatorname{Tcross}_{p}\left(T_{2}\right.$, Tlabels $\left._{p}\left(T_{1}\right)\right) \cup M_{1}^{\prime \prime} \cup M_{2}^{\prime \prime}$ and 21) $M^{\prime}=$ $\operatorname{Tcross}_{p}\left(T_{2}\right.$, Tlabels $\left._{p}\left(T_{1}^{\prime}\right)\right) \cup M_{1}^{\prime \prime \prime} \cup M_{2}^{\prime \prime}$. We use Lemma (7.15) with 2) to get 22) $\operatorname{Tlabels}_{p}\left(T_{1}^{\prime}\right) \subseteq \operatorname{Tlabels}_{p}\left(T_{1}\right)$. We now use Lemma (7.10) with 22) to get 23) $\operatorname{Trross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}^{\prime}\right)\right) \subseteq$ $\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right)$. From 18),20),21) and 23) we may get $M^{\prime} \subseteq M$.

Suppose we step by Rule (6) the we may proceed using similar logic as the previous case.

If $T \equiv\langle s\rangle$ then we now perform induction on $s$ which gives us an additional seven cases.

If $s \equiv s k i p^{l}$ then we take a step by Rule (7) and have 1) $T^{\prime}=\sqrt{ }$. We may substitute 1 ) in 0 ) to get 2) $p, E, \emptyset \vdash \sqrt{ }: M^{\prime}$. From Rule (49) we have 3) $M^{\prime}=\emptyset$. From 3) we see that $M^{\prime} \subseteq M$.

If $s \equiv s_{k i p}{ }^{l} s_{1}$ then we take a step by Rule (8) and have 1) $T^{\prime}=\left\langle s_{1}\right\rangle$. We may substitute 1) in 0) to get 2) $p, E, \emptyset \vdash s_{1}: M^{\prime}$. Using Rule (48) we have 3) $p, E, \emptyset \vdash s: M_{s}, O_{s}, 4$ ) $M=M_{s}$, 5) $p, E, \emptyset \vdash s_{1}: M_{s}^{\prime}, O_{s}^{\prime}$ and 6) $M^{\prime}=M_{s}^{\prime}$. From Rule (51) we have 7) $p, E, \emptyset \vdash s_{1}: M_{s_{1}}, O_{s_{1}}$ and 8) $M_{s}=\operatorname{Lcross}(l, \emptyset) \cup M_{s_{1}}$. We may use Lemma (8) on 5) and 7) to get 9) $M_{s}^{\prime}=M_{s_{1}}$. From 4),6),8) and 9) we see that $M^{\prime} \subseteq M$.

If $s \equiv a[d]=^{l} e ; s_{1}$ then we step by Rule (9) then we may proceed using similar logic as the previous case.

If $s \equiv$ while $^{l}(a[d] \neq 0) s_{1} s_{2}$ then there are two rules by which we may take a step.

Suppose we step by Rule (10) then we have 1) $T^{\prime}=\left\langle s_{2}\right\rangle$. We substitute 1) in 0) to get 2) $p, E, \emptyset \vdash\left\langle s_{2}\right\rangle: M^{\prime}$. Let 3) $R=\emptyset$. From Rule (48) we have 4) $\left.p, E, R \vdash\langle s\rangle: M_{s}, 5\right) M=M_{s}, 6$ ) $p, E, R \vdash\left\langle s_{2}\right\rangle: M_{s}^{\prime}$ and 7) $M^{\prime}=M_{s}^{\prime}$. From Rule (53) we have 8) $\left.p, E, R \vdash s_{1}: M_{s_{1}}, O_{s_{1}}, 9\right) p, E, O_{s_{1}} \vdash s_{2}: M_{s_{2}}, O_{s_{2}}$ and 10) $M_{s}=\operatorname{Lcross}\left(l, O_{s_{1}}\right) \cup S \operatorname{cross}_{p}\left(s_{1}, O_{s_{1}}\right) \cup M_{s_{1}} \cup M_{s_{2}}$. Applying Lemma (12) to 6),8) and 9) we get 11) $\left.p, E, \emptyset \vdash s_{2}: M_{s}^{\prime \prime}, O_{s}^{\prime \prime}, 12\right)$ $M_{s}^{\prime}=\operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M_{s}^{\prime \prime}$, 13) $\left.p, E, \emptyset \vdash s_{1}: M_{s_{1}}^{\prime \prime}, O_{s_{1}}^{\prime \prime}, 14\right)$ $O_{s_{1}}=R \cup O_{s_{1}}^{\prime \prime}$, 15) $p, E, \emptyset \vdash s_{2}: M_{s_{2}}^{\prime \prime}, O_{s_{2}}^{\prime \prime}$ and 16) $M_{s_{2}}=$ $\operatorname{Scross}_{p}\left(s_{2}, O_{s_{1}}\right) \cup M_{s_{2}}^{\prime \prime}$. From Lemma (8) applied to 11) and 15) we get 17) $M_{s}^{\prime \prime}=M_{s_{2}}^{\prime \prime}$. Substituting 14) and 17) in 16) gives us 18) $M_{s_{2}}=\operatorname{Scross}_{p}\left(s_{2}, R \cup O_{s_{1}}^{\prime \prime}\right) \cup M_{s}^{\prime \prime}$. Using Lemma (7.5) on 18) results in 19) $M_{s_{2}}=\operatorname{Scross}_{p}\left(s_{2}, O_{s_{1}}^{\prime \prime}\right) \cup \operatorname{Scross}_{p}\left(s_{2}, R\right) \cup M_{s}^{\prime \prime}$. From 12),17) and 19) we have 20) $M_{s}^{\prime} \subseteq M_{s_{2}}$. Finally from 5),7),10) and 20) we have $M^{\prime} \subseteq M$.

Suppose we step by Rule (11) then we have 1) $T^{\prime}=\left\langle s_{1} \cdot s\right\rangle$. Substituting 1) in 0) gives us 2) $p, E, R \vdash s_{1} . s: M^{\prime}$. Let 3) $R=$ $\emptyset$. From Rule (48) we have 4) $\left.p, E, R \vdash s: M_{s}, O_{s}, 5\right) M=M_{s}$, 6) $p, E, R \vdash s_{1} \cdot s: M_{s}^{\prime}, O_{s}^{\prime}$ and 7) $M^{\prime}=M_{s}^{\prime}$. From Lemma (10) there exists $M_{s_{1}}^{\prime}, M_{s s}^{\prime}, O_{s_{1}}^{\prime}$ and $O_{s s}^{\prime}$ such that 8) $p, E, R \vdash s_{1}$ : $M_{s_{1}}^{\prime}, O_{s_{1}}^{\prime}$ and 9) $p, E, O_{s_{1}}^{\prime} \vdash s: M_{s s}^{\prime}, O_{s s}^{\prime}$. We may use Lemma (14) with 6),8) and 9) to get 10) $M_{s}^{\prime}=M_{s_{1}}^{\prime} \cup M_{s s}^{\prime}$. From Rule (53) we have 11) $p, E, R \vdash s_{1}: M_{1}, O_{1}$, 12) $p, E, O_{1} \vdash s_{2}$ : $\left.M_{2}, O_{2}, 13\right) M_{s}=\operatorname{Lcross}\left(l, O_{1}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{1}\right) \cup M_{1} \cup M_{2}$, 14) $p, E, O_{s_{1}}^{\prime} \vdash s_{1}: M_{1}^{\prime}, O_{1}^{\prime}$, 15) $p, E, O_{1}^{\prime} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$ and 16) $M_{s s}^{\prime}=\operatorname{Lcross}\left(l, O_{1}^{\prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{1}^{\prime}\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$. Using Lemma (8) with 8) and 11) we have 17) $M_{s_{1}}^{\prime}=M_{1}$ and 18) $O_{s_{1}}^{\prime}=O_{1}$. Applying Lemma (12) to 11) and 14) gives us 19) $\left.p, E, \emptyset \vdash s_{1}: M_{1}^{\prime \prime}, O_{1}^{\prime \prime}, 20\right) M_{1}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime \prime}$, 21) $O_{1}=R \cup O_{1}^{\prime \prime}$, 22) $\left.p, E, \emptyset \vdash s_{1}: M_{1}^{\prime \prime \prime}, O_{1}^{\prime \prime}, 23\right) M_{1}^{\prime}=$ $\operatorname{Scross}_{p}\left(s_{1}, O_{s_{1}}^{\prime}\right) \cup M_{1}^{\prime \prime \prime}$ and 24) $O_{1}^{\prime}=O_{s_{1}}^{\prime} \cup O_{1}^{\prime \prime \prime}$. We apply Lemma (8) to 19) and 22) to get 25) $M_{1}^{\prime \prime}=M_{1}^{\prime \prime \prime}$ and 26) $O_{1}^{\prime \prime}=$ $O_{1}^{\prime \prime \prime}$. Let us substitute 18) and 26) in 24) to get 27) $O_{1}^{\prime}=O_{1} \cup O_{1}^{\prime \prime}$. We substitute 21) in 27) to get 28) $O_{1}^{\prime}=R \cup O_{1}^{\prime \prime} \cup O_{1}^{\prime \prime}=R \cup O_{1}^{\prime \prime}$. From 21) and 28) we get 29) $O_{1}=O_{1}^{\prime}$. Substituting 29) in 15) we get 30) $p, E, O_{1} \vdash s_{2}: M_{2}^{\prime}, O_{2}^{\prime}$. Using Lemma (8) on 12) and 30) yields 31) $M_{2}=M_{2}^{\prime}$. We now substitute 13),20) and 21) in 5) to get 32) $M=\operatorname{Lcross}\left(l, R \cup O_{1}^{\prime \prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime \prime}\right) \cup$ $\operatorname{Scross}{ }_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime \prime} \cup M_{2}$. Using Lemma (7.5) we may simplify 32) to 33) $M=\operatorname{Lcross}\left(l, R \cup O_{1}^{\prime \prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime \prime}\right) \cup$ $M_{1}^{\prime \prime} \cup M_{2}$. Substituting 10),16),17),20),23),25) and 31) in 7) results in 34) $M^{\prime}=\operatorname{Scross}_{p}\left(s_{1}, R\right) \cup M_{1}^{\prime \prime} \cup L \operatorname{cross}\left(l, R \cup O_{1}^{\prime \prime}\right) \cup$ $\operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime \prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime \prime}\right) \cup M_{1}^{\prime \prime} \cup M_{2}$. From 34) we use Lemma (7.5) and simplify to 35) $M^{\prime}=\operatorname{Lcross}(l, R \cup$ $\left.O_{1}^{\prime \prime}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, R \cup O_{1}^{\prime \prime}\right) \cup M_{1}^{\prime \prime} \cup M_{2}$. From 33) and 35) we see $M^{\prime} \subseteq M$.

If $s \equiv$ async $^{l} s_{1} s_{2}$ then we take a step by Rule (12) and have 1) $T^{\prime}=\left\langle s_{1}\right\rangle \|\left\langle s_{2}\right\rangle$. We substitute 1) in 0) to get 2) $p, E, \emptyset \vdash\left\langle s_{1}\right\rangle \|\left\langle s_{2}\right\rangle: M^{\prime}$. Let 3) $T_{1}=\left\langle s_{1}\right\rangle$ and 4) $T_{2}=\left\langle s_{2}\right\rangle$. From Rule (47) we have 5) $p, E$, Tlabels $_{p}\left(T_{2}\right) \vdash\left\langle s_{1}\right\rangle: M_{1}^{\prime}$, 6) $p, E$, Tlabel $_{p}\left(T_{1}\right) \vdash\left\langle s_{2}\right\rangle: M_{2}^{\prime}$ and 7) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. From Rule (48) we have 8) $\left.p, E, \emptyset \vdash s: M_{s}, O_{s}, 9\right) M=M_{s}$, 10) $p, E$, Tlabels $p_{p}\left(T_{2}\right) \vdash s_{1}: M_{s_{1}}^{\prime}, O_{s_{1}}^{\prime}$, 11) $M_{1}^{\prime}=M_{s_{1}}^{\prime}$, 12) $p, E$, Tlabel $_{p}\left(T_{1}\right) \vdash s_{2}: M_{s_{2}}^{\prime}, O_{s_{2}}^{\prime}$ and 13) $M_{2}^{\prime}=M_{s_{2}}^{\prime}$. From Rule (54) we have 14) $p, E$, Slabels $s_{p}\left(s_{2}\right) \vdash s_{1}: M_{1}, O_{1}$, 15) $p, E$, $\operatorname{Slabels}_{p}\left(s_{1}\right) \vdash s_{2}: M_{2}, O_{2}$ and 16) $M_{s}=M_{1} \cup$ $M_{2}$. From the definition of Tlabels() we may simplify 10) and 12) to 17) $p, E, \operatorname{Slabels}_{p}\left(s_{2}\right) \vdash s_{1}: M_{s_{1}}^{\prime}, O_{s_{1}}^{\prime}$ and 18) $p, E$, Slabel $s_{p}\left(s_{1}\right) \vdash s_{2}: M_{s_{2}}^{\prime}, O_{s_{2}}^{\prime}$. We use Lemma (8) on 14) and 17) and on 15) and 18) to get 19) $M_{s_{1}}^{\prime}=M_{1}$ and 20) $M_{s_{2}}^{\prime}=M_{2}$. From 7),9),16),19) and 20) we have $M^{\prime} \subseteq M$.

If $s \equiv$ finish ${ }^{l} s_{1} s_{2}$ then we step by Rule (13) which gives us 1) $T^{\prime}=\left\langle s_{1}\right\rangle \triangleright\left\langle s_{2}\right\rangle$. Substituting 1) in 0 ) results in 2) $p, E, \emptyset \vdash$ $\left\langle s_{1}\right\rangle \triangleright\left\langle s_{2}\right\rangle: M^{\prime}$. From Rule (46) we have 3) $p, E, \emptyset \vdash\left\langle s_{1}\right\rangle: M_{1}^{\prime}$, 4) $p, E, \emptyset \vdash\left\langle s_{2}\right\rangle: M_{2}^{\prime}$ and 5) $M^{\prime}=M_{1}^{\prime} \cup M_{2}^{\prime}$. From Rule (48) we have 6) $\left.\left.p, E, \emptyset \vdash s: M_{s}, O_{s}, 7\right) M=M_{s}, 8\right) p, E, \emptyset \vdash s_{1}$ : $\left.M_{s_{1}}^{\prime}, O_{s_{1}}^{\prime}, 9\right) M_{1}^{\prime}=M_{s_{1}}^{\prime}$, 10) $p, E, \emptyset \vdash s_{2}: M_{s_{2}}^{\prime}, O_{s_{2}}^{\prime}$ and 11) $M_{2}^{\prime}=M_{s_{2}}^{\prime}$. From Rule (55) we get 12) $p, E, \emptyset \vdash s_{1}: M_{s_{1}}, O_{s_{1}}$, 13) $p, E, \emptyset \vdash s_{2}: M_{s_{2}}, O_{s_{2}}$ and 14) $M_{s}=\operatorname{Lcross}(l, \emptyset) \cup M_{s_{1}} \cup$ $M_{s_{2}}$. Using Lemma (8) on 8) and 12) and on 10) and 13) gives us 15) $M_{s_{1}}=M_{s_{1}}^{\prime}$ and 16) $M_{s_{2}}=M_{s_{2}}^{\prime}$. Substituting 14),15) and 16) in 7) gives us 17) $M=\operatorname{Lcross}(l, \emptyset) \cup M_{s_{1}}^{\prime} \cup M_{s_{2}}^{\prime}$. We substitute 9) and 11) in 5) to get 18) $M^{\prime}=M_{s_{1}}^{\prime} \cup M_{s_{2}}^{\prime}$. From 17) and 18) we see $M^{\prime} \subseteq M$.

If $s \equiv f_{i}()^{l} k$ then we step by Rule (14) which gives us 1) $p\left(f_{i}\right)=s_{i}$ and 2) $T^{\prime}=\left\langle s_{i} \cdot k\right\rangle$. From $\vdash p: E$ and Rule (45) we also have 3) $E\left(f_{i}\right)=\left(M_{i}, O_{i}\right)$ and 4) $p, E, \emptyset \vdash s_{i}: M_{i}, O_{i}$. Substituting 2) in 0) gives us 5) $p, E, \emptyset \vdash s_{i} . k: M^{\prime}$. From Rule (48) we have 6) $\left.p, E, \emptyset \vdash s: M_{s}, O_{s}, 7\right) M=M_{s}$, 8)
$p, E, \emptyset \vdash s_{i} . k: M_{s}^{\prime}, O_{s}^{\prime}$ and 9) $M^{\prime}=M_{s}^{\prime}$. Using Rule (56) on 6) gives us 10) $\left.p, E, O_{i} \vdash k: M_{k}, O_{k}, 11\right) M_{s}=\operatorname{Lcross}(l, \emptyset) \cup$ $\operatorname{symcross}^{\left(\operatorname{Slabels}_{p}\left(s_{i}\right), \emptyset\right) \cup M_{i} \cup M_{k}=M_{i} \cup M_{k} \text {. Applying }}$ Lemma (14) with the premise, 4), 8) and 10) gives 12) $M_{s}^{\prime}=$ $M_{i} \cup M_{k}$. From 7),9),11) and 12) we get $M=M^{\prime}$ and thus $M^{\prime} \subseteq M$.

### 8.5 Approximation

We now prove that our type system produces a label pair set $M$, such that if two statements can execute in parallel, then the pairing of their labels will appear in $M$.

Lemma 17. If $p, E, \emptyset \vdash T: M$ then $\operatorname{parallel}(T) \subseteq M$.
Proof. Let us perform induction on $T$. There are four cases.
If $T \equiv \sqrt{ }$ then from Rule (49) we have 1) $M=\emptyset$. From the definition of $\operatorname{parallel}(), 2) \operatorname{parallel}(T)=\emptyset$. From 1) and 2) we see $\operatorname{parallel}(T) \subseteq M$.

If $T \equiv T_{1} \triangleright T_{2}$ then from Rule (46) we have 1) $p, E, \emptyset \vdash T_{1}$ : $M_{1}$, 2) $p, E, \emptyset \vdash T_{2}: M_{2}$ and 3) $M=M_{1} \cup M_{2}$. From the definition of $\operatorname{parallel}()$ we have 4) $\operatorname{parallel}(T)=\operatorname{parallel}\left(T_{1}\right)$. Using the induction hypothesis on 1) yields 5) $\operatorname{parallel}\left(T_{1}\right) \subseteq M_{1}$ and From 3),4) and 5) we have parallel $(T) \subseteq M$.

If $T \equiv T_{1} \| T_{2}$ then from Rule (47) we have

1) $p$, E, Tlabels $p_{p}\left(T_{2}\right) \vdash T_{1}: M_{1}$, 2) $p, E$, Tlabels $s_{p}\left(T_{1}\right) \vdash T_{2}$ : $M_{2}$ and 3) $M=M_{1} \cup M_{2}$. We apply Lemma (13) to 1) and 2) to get 4) $\left.p, E, \emptyset \vdash T_{1}: M_{1}^{\prime}, 5\right) M_{1}=\operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup M_{1}^{\prime}$, 6) $p, E, \emptyset \vdash T_{2}: M_{2}^{\prime}$ and 7) $M_{2}=\operatorname{Tcross}_{p}\left(T_{2}, \operatorname{Tlabels}_{p}\left(T_{1}\right)\right) \cup$ $M_{2}^{\prime}$. Using Lemma (7.8) and substituting 5) and 7) in 3) gives us 8) $M=\operatorname{Tcross}_{p}\left(T_{1}, \operatorname{Tlabels}_{p}\left(T_{2}\right)\right) \cup M_{1}^{\prime} \cup M_{2}^{\prime}$. Using the induction hypothesis on 4) and 6) yields 9) $\operatorname{parallel}\left(T_{1}\right) \subseteq M_{1}^{\prime}$ and 10) $\operatorname{parallel}\left(T_{2}\right) \subseteq M_{2}^{\prime}$. Unfolding the definition of parallel () gives us 11) $\operatorname{parallel}(T)=\operatorname{parallel}\left(T_{1}\right) \cup \operatorname{parallel}\left(T_{2}\right) \cup$ symcross $\left(F\right.$ Tlabels $\left(T_{1}\right)$, FTlabels $\left.\left(T_{2}\right)\right)$. Using Lemma (7.14) gives us
2) $\operatorname{symcross}\left(F \operatorname{Tlabels}\left(T_{1}\right)\right.$, FTlabels $\left.\left(T_{2}\right)\right) \subseteq$
$\operatorname{Tcross}_{p}\left(T_{1}\right.$, Tlabels $\left._{p}\left(T_{2}\right)\right)$. From 8),9),10),11) and 12) we have $\operatorname{parallel}(T) \subseteq M$.

If $T \equiv\langle s\rangle$ then from the definition of $\operatorname{parallel}()$ we have $\operatorname{parallel}(T)=\emptyset$ which makes parallel $(T) \subseteq M$ trivial.

### 8.6 Soundness

We are now ready to prove Theorem 2, which we restate here:
Theorem (Soundness) If $\vdash p: E, p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{*}(p, A, T)$ then $\operatorname{parallel}(T) \subseteq M$.
Proof. We will first show that:
Claim A: If $\vdash p: E, p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{*}$ $(p, A, T)$, then there exists $M^{\prime}$ such that $p, E, \emptyset \vdash T: M^{\prime}$ and $M^{\prime} \subseteq M$.

It is sufficient to show that:

> Claim B: For all $i$ : if $\vdash p: E, p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \vec{T}^{i}(p, A, T)$, then there exists $M^{\prime}$ such that $p, E, \emptyset \vdash T: M^{\prime}$ and $M^{\prime} \subseteq M$.

We proceed by induction on $i$. In the base case of $i=0$, we have $\left\langle s_{0}\right\rangle=T$ and we can choose $M^{\prime}=M$. From $p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left\langle s_{0}\right\rangle=T$ and $M^{\prime}=M$, we immediately have $p, E, \emptyset \vdash T$ : $M^{\prime}$ and $M^{\prime} \subseteq M$. In the induction step, suppose we have Claim B for a particular $i$, and consider $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{i}(p, A, T) \rightarrow$ ( $p, A^{\prime}, T^{\prime}$ ). From the induction hypothesis, we have $M^{\prime}$ such that $p, E, \emptyset \vdash T: M^{\prime}$ and $M^{\prime} \subseteq M$. From $\vdash p: E, p, E, \emptyset \vdash T: M^{\prime}$ and $(p, A, T) \rightarrow\left(p, A^{\prime}, T^{\prime}\right)$ and Lemma (16), we have that there
exists $M^{\prime \prime}$ such that $p, E, \emptyset \vdash T^{\prime}: M^{\prime \prime}$ and $M^{\prime \prime} \subseteq M^{\prime}$. Finally, from $M^{\prime \prime} \subseteq M^{\prime}$ and $M^{\prime} \subseteq M$, we have $M^{\prime \prime} \subseteq M$. This completes the proof of Claim B and therefore the proof of Claim A.

To prove the soundness theorem itself, suppose $\vdash p: E$, $p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{*}(p, A, T)$. From $\vdash p: E, p, E, \emptyset \vdash\left\langle s_{0}\right\rangle: M$ and $\left(p, A_{0},\left\langle s_{0}\right\rangle\right) \rightarrow^{*}(p, A, T)$ and Claim A, we have that there exists $M^{\prime}$ such that $p, E, \emptyset \vdash T: M^{\prime}$ and $M^{\prime} \subseteq M$. From $p, E, \emptyset \vdash T: M^{\prime}$ and Lemma (17) we have $\operatorname{parallel}(T) \subseteq M^{\prime}$. Since $M^{\prime} \subseteq M$, we have $\operatorname{parallel}(T) \subseteq M$, as desired.

## Appendix C: Proof of Theorem 4

Let $\varphi, \psi$ be valuations of the set variables in two, possibly different, constraints systems We say that $\varphi, \psi$ agree on their common domain, if for all $v \in \operatorname{dom}(\varphi) \cap \operatorname{dom}(\psi): \varphi(v)=\psi(v)$. If $\varphi, \psi$ agree on their common domain, then we define
$\varphi \cup \psi=\lambda v \in \operatorname{dom}(\varphi) \cup \operatorname{dom}(\psi) \cdot \begin{cases}\varphi(v) & \text { if } v \in \operatorname{dom}(\varphi) \\ \psi(v) & \text { otherwise }\end{cases}$
LEMMA 18. $p, E, R \vdash s: M, O$ if and only if there exists $a$ solution $\varphi$ to $C(s)$ where $\varphi\left(r_{s}\right)=R$ and $\varphi\left(o_{s}\right)=O$ and $\varphi\left(m_{s}\right)=M$ and $\varphi$ extends $E$.

Proof. $\Leftarrow)$ Let us now perform induction on $s$ and examine the seven cases.

If $s \equiv s k i p^{l}$ then from constraints (60-61) we have 1) $\varphi\left(r_{s}\right)=$ $\varphi\left(o_{s}\right)$ and 2) $\varphi\left(m_{s}\right)=\operatorname{Lcoss}\left(l, \varphi\left(r_{s}\right)\right)$. Substituting the premise in 1) and 2) gives us 3) $R=O$ and 4) $M=\operatorname{Lcross}(l, R)$. We may apply Rule (50) with 3) and 4) to get $p, E, R \vdash s: M, O$.

If $s \equiv s k i p^{l} s_{1}$ then from constraints (62-64) we have 1) $\varphi\left(r_{s}\right)=\varphi\left(r_{s_{1}}\right)$, 2) $\varphi\left(o_{s}\right)=\varphi\left(o_{s_{1}}\right)$ and 3) $\varphi\left(m_{s}\right)=$ $\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{s_{1}}\right)$. Let 4) $\varphi\left(m_{s_{1}}\right)=M_{1}$. Substituting the premise and 4) in 1),2) and 3) gives us 5) $\left.R=\varphi\left(r_{s_{1}}\right), 6\right)$ $O=\varphi\left(o_{s_{1}}\right)$ and 7) $M=\operatorname{Lcross}(l, R) \cup M_{1}$. From the definition of $C(s)$ we have $C\left(s_{1}\right) \subseteq C(s)$. We see that since $\varphi$ is a solution to $C(s), \varphi$ is also a solution to $C\left(s_{1}\right)$. Since $\varphi$ is a solution to $C\left(s_{1}\right)$ and extends $E$ we may use the induction hypothesis with 4),5) and 6) to get 8) $p, E, R \vdash s_{1}: M_{1}, O$. Using 7) and 8) we may use Rule (51) to get $p, E, R \vdash s: M, O$.

If $s \equiv a[d]={ }^{l} e ; s_{1}$ then we proceed using similar logic as the previous case.

If $s \equiv$ while $^{l}(a[d] \neq 0) s_{1} s_{2}$ then from constraints (6871) we have 1) $\varphi\left(r_{s}\right)=\varphi\left(r_{s_{1}}\right)$, 2) $\varphi\left(r_{s_{2}}\right)=\varphi\left(o_{s_{1}}\right)$, 3) $\varphi\left(o_{s}\right)=$ $\varphi\left(o_{s_{2}}\right)$ and 4) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(o_{s_{1}}\right)\right) \cup \operatorname{Scoss}_{p}\left(s_{1}, \varphi\left(o_{s_{1}}\right)\right) \cup$ $\varphi\left(m_{s_{1}}\right) \cup \varphi\left(m_{s_{2}}\right)$ Let 5) $\left.\varphi\left(o_{s_{1}}\right)=O_{1}, 6\right) \varphi\left(m_{s_{1}}\right)=M_{1}$ and 7) $\varphi\left(m_{s_{2}}\right)=M_{2}$. Substituting the premise, 5), 6) and 7) in 1),2),3), and 4) gives us 8) $\left.\left.R=\varphi\left(r_{s_{1}}\right), 9\right) \varphi\left(r_{s_{2}}\right)=O_{1}, 10\right) O=\varphi\left(o_{s_{2}}\right)$ and 11) $M=\operatorname{Lcoss}\left(l, O_{1}\right) \cup \operatorname{Scoss}_{p}\left(s_{1}, O_{1}\right) \cup M_{1} \cup M_{2}$. From the definition of $C(s)$ we have $C\left(s_{1}\right) \subseteq C(s)$ and $C\left(s_{2}\right) \subseteq C(s)$. Since $\varphi$ is a solution to $C(s), \varphi$ is also a solution to both $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$. Since $\varphi$ is a solution to $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$ and $\varphi$ extends $E$ we use the induction hypothesis with the 5),6),7),8),9) and 10) to get 12) $p, E, R \vdash s_{1}: M_{1}, O_{1}$ and 13) $p, E, O_{1} \vdash s_{2}: M_{2}, O$. We may now apply Rule (53) with 11),12) and 13) to get $p, E, R \vdash s$ : $M, O$.

If $s \equiv$ async $^{l} s_{1} s_{2}$ then from constraints (72-75) we obtain 1) $\varphi\left(r_{s_{1}}\right)=$ Slabels $_{p}\left(s_{2}\right) \cup \varphi\left(r_{s}\right)$, 2) $\varphi\left(r_{s_{2}}\right)=\operatorname{Slabels}_{p}\left(s_{1}\right) \cup$ $\varphi\left(r_{s}\right)$, 3) $\varphi\left(o_{s}\right)=\varphi\left(o_{s_{2}}\right)$ and 4) $\varphi\left(m_{s}\right)=\operatorname{Lcoss}\left(l, \varphi\left(r_{s}\right)\right) \cup$ $\varphi\left(m_{s_{1}}\right) \cup \varphi\left(m_{s_{2}}\right)$. Let 5) $\left.\varphi\left(m_{s_{1}}\right)=M_{1}, 6\right) \varphi\left(m_{s_{2}}\right)=M_{2}$ and 7) $\varphi\left(o_{s_{1}}\right)=O_{1}$. Substituting the premise, 5) and 6) in 1),2),3) and 4) gives us 8) $\varphi\left(r_{s_{1}}\right)=$ Slabel $_{p}\left(s_{2}\right) \cup R$, 9) $\varphi\left(r_{s_{2}}\right)=$ $\left.\operatorname{Slabels}_{p}\left(s_{1}\right) \cup R, 10\right) O=\varphi\left(o_{s_{2}}\right)$ and 11) $M=\operatorname{Lcross}(l, R) \cup$ $M_{1} \cup M_{2}$. From the definition of $C(s)$ we have $C\left(s_{1}\right) \subseteq C(s)$ and $C\left(s_{2}\right) \subseteq C(s)$. Since $\varphi$ is a solution to $C(s), \varphi$ is also a solution to both $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$. Since $\varphi$ is a solution to $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$ and $\varphi$ extends $E$ we use the induction hypothesis with the premise,5),6),7),8),9) and 10) to get 12) $p, E, \operatorname{Slabels}_{p}\left(s_{2}\right) \cup R \vdash$ $s_{1}: M_{1}, O_{1}$ and 13) $p, E$, Slabel $s_{p}\left(s_{1}\right) \cup R \vdash s_{2}: M_{2}, O$. Using Rule (54) with 11),12) and 13) gives us $p, E, R \vdash s: M, O$.

If $s \equiv$ finish $^{l} s_{1} s_{2}$ then from constraints (76-79) we get 1) $\varphi\left(r_{s_{1}}\right)=\varphi\left(r_{s}\right)$, 2) $\varphi\left(r_{s_{2}}\right)=\varphi\left(r_{s}\right)$, 3) $\varphi\left(o_{s_{2}}\right)=\varphi\left(o_{s}\right)$ and 4) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{s_{1}}\right) \cup \varphi\left(m_{s_{2}}\right)$. Let 5) $\left.\varphi\left(m_{s_{1}}\right)=M_{1}, 6\right) \varphi\left(m_{s_{2}}\right)=M_{2}$ and 7) $\varphi\left(o_{s_{1}}\right) \xlongequal{=} O_{1}$. Substituting the premise, 5) and 6) in 1),2),3) and 4) results in 8) $\varphi\left(r_{s_{1}}\right)=R$, 9) $\varphi\left(r_{s_{2}}\right)=R$, 10) $\varphi\left(O_{s_{2}}\right)=O$ and 11) $M=\operatorname{Lcross}(l, R) \cup M_{1} \cup M_{2}$. From the definition of $C(s)$ we
have $C\left(s_{1}\right) \subseteq C(s)$ and $C\left(s_{2}\right) \subseteq C(s)$. Since $\varphi$ is a solution to $C(s), \varphi$ is also solution to both $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$. Because $\varphi$ is a solution to $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$ and $\varphi$ extends $E$ we use the induction hypothesis with the premise,5),6),7),8),9) and 10) to get 12) $p, E, R \vdash s_{1}: M_{1}, O_{1}$ and 13) $p, E, R \vdash s_{2}: M_{2}, O$. We apply Rule (55) with 11 ),12) and 13) to get $p, E, R \vdash s: M, O$.

If $s \equiv f_{i}() k$ then from constraints (80-82) we have 1) $\varphi\left(r_{k}\right)=\varphi\left(r_{s}\right) \cup \varphi\left(o_{i}\right)$, 2) $\varphi\left(o_{k}\right)=\varphi\left(o_{s}\right)$ and 3) $\varphi\left(m_{s}\right)=$ $\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup \operatorname{symcross}\left(\operatorname{Slabels}_{p}\left(p\left(f_{i}\right)\right), \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{i}\right) \cup$ $\varphi\left(m_{k}\right)$. Let 4) $\varphi\left(m_{i}\right)=M_{i}$ and 5) $\varphi\left(o_{i}\right)=O_{i}$. Let 6) $\varphi\left(m_{k}\right)=M_{k}$. Substituting the premise,4),5) and 6) in 1),2) and 3) gives us 7) $\left.\varphi\left(r_{k}\right)=R \cup O_{i}, 8\right) \varphi\left(o_{k}\right)=O$ and 9) $\left.M=\operatorname{Lcross}(l, R) \cup \operatorname{symcross}_{(S l a b e l}{ }_{p}\left(p\left(f_{i}\right)\right), R\right) \cup M_{i} \cup M_{k}$. From the definition of $C(s)$ we have $C(k) \subseteq C(s)$. Since $\varphi$ is a solution $C(s), \varphi$ is also a solution to $C(k)$. Because $\varphi$ is a solution to $C(k)$ and $\varphi$ extends $E$, we may apply the induction hypothesis with 6),7) and 8) to get 10) $p, E, R \cup O_{i} \vdash k: M_{k}, O$. From the premise we have that $\varphi$ extends $E$ which gives us 11) $E\left(f_{i}\right)=\left(\varphi\left(m_{i}\right), \varphi\left(o_{i}\right)\right)$. From 9),10) and 11) we may apply Rule (56) and obtain $p, E, R \vdash s: M, O$ as desired.
$\Rightarrow)$ Let us perform induction on $s$ and examine the seven cases.
If $s \equiv s k i p{ }^{\eta}$ then by Rule (50) we have 1) $M=\operatorname{Lcross}(l, R)$ and 2) $O=R$. Let us construct a solution $\varphi$ that extends $E$ and such that 3) $\varphi\left(r_{s}\right)=R$, 4) $\varphi\left(o_{s}\right)=O$ and 5) $\varphi\left(m_{s}\right)=$ $M$. We substitute 1),2) and 3) in 4) and 5) to get 6) $\varphi\left(o_{s}\right)=$ $R$ and 7) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right)$. From 8) and 9) we see constraints (60-61) are satisfied. From 3),4),5) we see that the other conditions of the conclusion are also satisfied.

If $s \equiv \operatorname{skip}^{l} s_{1}$ then by Rule (51) we have 1) $p, E, R \vdash s_{1}$ : $\left.M_{1}, O_{1}, 2\right) M=\operatorname{Lcross}(l, R) \cup M_{1}$ and 3) $O=O_{1}$. From the induction hypothesis to 1 ) we have a solution $\varphi_{1}$ to $C\left(s_{1}\right)$ which extends $E$ where 4) $\left.\varphi_{1}\left(r_{s_{1}}\right)=R, 5\right) \varphi_{1}\left(o_{s_{1}}\right)=O_{1}$ and 6) $\varphi_{1}\left(m_{s_{1}}\right)=M_{1}$. Let 7) $\varphi=\varphi_{1}\left[r_{s} \mapsto R, m_{s} \mapsto M, o_{s} \mapsto O\right]$. From the definition of extension with 4),5) and 6) we have 8) $\varphi\left(r_{s}\right)=R$, 9) $\varphi\left(o_{s}\right)=O$, 10) $\varphi\left(m_{s}\right)=M$, 11) $\varphi\left(r_{s_{1}}\right)=R$, 12) $\varphi\left(o_{s_{1}}\right)=O_{1}$ and 13) $\varphi\left(m_{s_{1}}\right)=M_{1}$. From 8) and 11) we have 14) $\varphi\left(r_{s}\right)=\varphi\left(r_{s_{1}}\right)$. From 3),9) and 12) we get 15) $\varphi\left(o_{s}\right)=\varphi\left(o_{s_{1}}\right)$. From 2),8),10) and 13) we obtain 16) $\varphi\left(m_{s}\right)=$ $\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{s_{1}}\right)$. Since $\varphi$ extends $\varphi_{1}, \varphi$ also extends $E$ and is a solution to $C\left(s_{1}\right)$. With 14$), 15$ ) and 16) we satisfy constraints (62-64) and thus $\varphi$ is a solution to $C(s)$. From 8),9) and 10) we satisfy the additional conditions of the conclusion.

If $s \equiv a[d]=^{l} e ; s_{1}$ then we proceed using similar logic as the previous case.

If $s \equiv$ while $(a[d] \neq 0) s_{1} s_{2}$ then from Rule (53) we have 1) $p, E, R \vdash s_{1}: M_{1}, O_{1}$, 2) $\left.p, E, O_{1} \vdash s_{2}: M_{2}, O_{2}, 3\right) M=$ $\operatorname{Lcross}\left(l, O_{1}\right) \cup \operatorname{Scross}_{p}\left(s_{1}, O_{1}\right) \cup M_{1} \cup M_{2}$ and 4) $O=O_{2}$. Applying the induction hypothesis to 1) yields a solution $\varphi_{1}$ to $C\left(s_{1}\right)$ that extends $E$ and 5) $\left.\varphi_{1}\left(r_{s_{1}}\right)=R, 6\right) \varphi_{1}\left(o_{s_{1}}\right)=O_{1}$ and 7) $\varphi_{1}\left(m_{s_{1}}\right)=M_{1}$. Applying the induction hypothesis to 2 ) yields a solution $\varphi_{2}$ to $C\left(s_{2}\right)$ that extends $E$ such that 8) $\varphi_{2}\left(r_{s_{2}}\right)=O_{1}$, 9) $\varphi_{2}\left(o_{s_{2}}\right)=O_{2}$ and 10) $\varphi_{2}\left(m_{s_{2}}\right)=M_{2}$. Notice that $\varphi_{1}$ and $\varphi_{2}$ agree on their common domain. Let 11) $\varphi=\varphi_{1} \cup \varphi_{2}$. We have that $\varphi$ is a solution to both $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$, and that $\varphi$ extends $E$. From our definition of $\varphi$, we have 12) $\varphi\left(r_{s_{1}}\right)=R$, 13) $\left.\left.\left.\varphi\left(o_{s_{1}}\right)=O_{1}, 14\right) \varphi\left(m_{s_{1}}\right)=M_{1}, 15\right) \varphi\left(r_{s_{2}}\right)=O_{1}, 16\right)$ $\varphi\left(o_{s_{2}}\right)=O_{2}$ and 17) $\varphi\left(m_{s_{2}}\right)=M_{2}$. From 11) we have 18) $\varphi\left(r_{s}\right)=R$, 19) $\varphi\left(o_{s}\right)=O$ and 20) $\varphi\left(m_{s}\right)=M$. From 12) and 18) we have 21) $\varphi\left(r_{s}\right)=\varphi\left(r_{s_{1}}\right)$. From 13) and 15) we get 22) $\varphi\left(o_{s_{1}}\right)=\varphi\left(r_{s_{2}}\right)$. Combining 3),13),14),17) and 20) gives us 23) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(o_{s_{1}}\right)\right) \cup \operatorname{Scross}\left(s_{1}, \varphi\left(o_{s_{1}}\right)\right) \cup \varphi\left(m_{s_{1}}\right) \cup$ $\varphi\left(m_{s_{2}}\right)$. We use 4),16) and 19) to get 24) $\varphi\left(o_{s}\right)=\varphi\left(o_{s_{2}}\right)$. We see from constraints (68-71) are satisfied by 21),22),23) and 24) and since $\varphi$ satisfies $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$ it is a solution to $C(s)$. From $18), 19)$ and 20 ) we satisfy the other conditions of the conclusion.

If $s \equiv \operatorname{async}^{l} s_{1} s_{2}$ then from Rule (54) we have 1) $p, E$, Slabel $\left.s_{p}\left(s_{2}\right) \cup R \vdash s_{1}: M_{1}, O_{1}, 2\right) p, E$, Slabel $s_{p}\left(s_{1}\right) \cup$ $\left.\left.R \vdash s_{2}: M_{2}, O_{2}, 3\right) M=\operatorname{Lcross}(l, R) \cup M_{1} \cup M_{2} 4\right) O=O_{2}$. Applying the induction hypothesis to 1) yields a solution $\varphi_{1}$ to $C\left(s_{1}\right)$ that extends $E$ and 5) $\left.\varphi_{1}\left(r_{s_{1}}\right)=\operatorname{Slabels}_{p}\left(s_{2}\right) \cup R, 6\right)$ $\varphi_{1}\left(o_{s_{1}}\right)=O_{1}$ and 7) $\varphi_{1}\left(m_{s_{1}}\right)=M_{1}$. Applying the induction hypothesis to 2 ) yields a solution $\varphi_{2}$ to $C\left(s_{2}\right)$ that extends $E$ and 8) $\varphi_{2}\left(r_{s_{2}}\right)=\operatorname{Slabel} s_{p}\left(s_{1}\right) \cup R$, 9) $\varphi_{2}\left(o_{s_{2}}\right)=O_{2}$ and 10) $\varphi_{2}\left(m_{s_{2}}\right)=M_{1}$. Notice that $\varphi_{1}$ and $\varphi_{2}$ agree on their common domain. Let 11) $\varphi=\varphi_{1} \cup \varphi_{2}$. We have that $\varphi$ is a solution to both $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$, and that $\varphi$ extends $E$. We will now show that $\varphi$ is a solution to $C(s)$. From our definition of $\varphi$ we have 12) $\varphi\left(r_{s_{1}}\right)=\operatorname{Slabels}_{p}\left(s_{2}\right) \cup R$, 13) $\varphi\left(o_{s_{1}}\right)=O_{1}$, 14) $\left.\left.\varphi\left(m_{s_{1}}\right)=M_{1}, 15\right) \varphi\left(r_{s_{2}}\right)=\operatorname{Slabels}_{p}\left(s_{1}\right) \cup R, 16\right) \varphi\left(o_{s_{2}}\right)=O_{2}$ and 17) $\varphi\left(m_{s_{2}}\right)=M_{2}$. From 11) we have 18) $\varphi\left(r_{s}\right)=R$, 19) $\varphi\left(o_{s}\right)=O$ and 20) $\varphi\left(m_{s}\right)=M$. From 12) and 18) we have 21) $\varphi\left(r_{s_{1}}\right)=\operatorname{Slabels}_{p}\left(s_{2}\right) \cup \varphi\left(r_{s}\right)$. From 15) and 18) we get 22) $\varphi\left(r_{s_{2}}\right)=\operatorname{Slabels}_{p}\left(s_{1}\right) \cup \varphi\left(r_{s}\right)$. Combining 3),14),17),18) and 20) gives us 23) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{s_{1}}\right) \cup \varphi\left(m_{s_{2}}\right)$. We use 4),16) and 19) to get 24) $\varphi\left(o_{s}\right)=\varphi\left(o_{s_{2}}\right)$. We see from constraints $(72-75)$ are satisfied by 21$), 22), 23$ ) and 24) and since $\varphi$ satisfies $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$ it is a solution to $C(s)$. From 18),19) and 20) we satisfy the other conditions of the conclusion.

If $s \equiv$ finish $^{l} s_{1} s_{2}$ then from Rule (55) we get 1) $p, E, R \vdash$ $\left.\left.s_{1}: M_{1}, O_{1}, 2\right) p, E, R \vdash s_{2}: M_{2}, O_{2}, 3\right) M=\operatorname{Lcoss}(l, R) \cup$ $M_{1} \cup M_{2}$ and 4) $O=O_{2}$. Applying the induction hypothesis to 1) yields a solution $\varphi_{1}$ to $C\left(s_{1}\right)$ that extends $E$ and 5) $\varphi_{1}\left(r_{s_{1}}\right)=R$, 6) $\varphi_{1}\left(o_{s_{1}}\right)=O_{1}$ and 7) $\varphi_{1}\left(m_{s_{1}}\right)=M_{1}$. Applying the induction hypothesis to 2) yields a solution $\varphi_{2}$ to $C\left(s_{2}\right)$ that extends $E$ and 8) $\varphi_{2}\left(r_{s_{2}}\right)=R$, 9) $\varphi_{2}\left(o_{s_{2}}\right)=O_{2}$ and 10) $\varphi_{2}\left(m_{s_{2}}\right)=M_{2}$. Notice that $\varphi_{1}$ and $\varphi_{2}$ agree on their common domain. Let 11) $\varphi=\varphi_{1} \cup \varphi_{2}$. We have that $\varphi$ is a solution to both $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$, and that $\varphi$ extends $E$. We will now show that $\varphi$ is a solution to $C(s)$. From our definition of $\varphi$ we have 12) $\varphi\left(r_{s_{1}}\right)=R$, 13) $\varphi\left(o_{s_{1}}\right)=O_{1}$, 14) $\left.\varphi\left(m_{s_{1}}\right)=M_{1}, 15\right) \varphi\left(r_{s_{2}}\right)=R$, 16) $\varphi\left(o_{s_{2}}\right)=O_{2}$ and 17) $\varphi\left(m_{s_{2}}\right)=M_{2}$. From 11) we have 18) $\varphi\left(r_{s}\right)=R$, 19) $\varphi\left(o_{s}\right)=O$ and 20) $\varphi\left(m_{s}\right)=M$. From 12) and 18) we have 21) $\varphi\left(r_{s}\right)=\varphi\left(r_{s_{1}}\right)$. From 15) and 18) we get 22) $\varphi\left(r_{s}\right)=\varphi\left(r_{s_{2}}\right)$. Combining 3),14),17),18) and 20) gives us 23) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{s_{1}}\right) \cup \varphi\left(m_{s_{2}}\right)$. We use 4),16) and 19) to get 24) $\varphi\left(o_{s}\right)=\varphi\left(o_{s_{2}}\right)$. We see from constraints (7679) are satisfied by 21$), 22), 23$ ) and 24) and since $\varphi$ satisfies $C\left(s_{1}\right)$ and $C\left(s_{2}\right)$ it is a solution to $C(s)$. From 18),19) and 20) we satisfy the other conditions of the conclusion.

If $s \equiv f_{i}() k$ then we have 1) $\left.E\left(f_{i}\right)=\left(M_{i}, O_{i}\right), 2\right) p, E, R \cup$ $O_{i} \vdash k: M_{k}, O_{k}$,
3) $\left.M=\operatorname{Lcross}(l, R) \cup \operatorname{symcross}^{(S l a b e l s}{ }_{p}\left(p\left(f_{i}\right)\right), R\right) \cup M_{i} \cup$ $M_{k}$ and 4) $O=O_{k}$. We may apply the induction hypothesis on 2) to get a solution $\varphi_{k}$ to $C(k)$ that extends $E$ and 5) $\varphi_{k}\left(r_{k}\right)=$ $R \cup O_{i}$, 6) $\varphi_{k}\left(o_{k}\right)=O_{k}$ and 7) $\varphi_{k}\left(m_{k}\right)=M_{k}$. Let 8) $\varphi=$ $\varphi_{k}\left[r_{s} \mapsto R, m_{s} \mapsto M, o_{s} \mapsto O\right]$. From the definition of extension with 5),6) and 7) we have 9) $\left.\left.\varphi\left(r_{s}\right)=R, 10\right) \varphi\left(o_{s}\right)=O, 11\right)$ $\left.\varphi\left(m_{s}\right)=M, 12\right) \varphi\left(r_{k}\right)=R \cup O_{i}$, 13) $\varphi\left(o_{k}\right)=O_{k}$ and 14) $\varphi\left(m_{k}\right)=M_{k}$. Since $\varphi$ extends $E$ we use the definition of extension with 1) to get 15) $\varphi\left(o_{i}\right)=O_{i}$ and 16) $\varphi\left(m_{i}\right)=$ $M_{i}$. From 12) and 15) we get 17) $\varphi\left(r_{k}\right)=\varphi\left(r_{s}\right) \cup \varphi\left(o_{i}\right)$. Using 4),10) and 13) we obtain 18) $\varphi\left(o_{s}\right)=\varphi\left(o_{k}\right)$. Combining 3),7),8),9),11) and 16) we get 19) $\varphi\left(m_{s}\right)=\operatorname{Lcross}\left(l, \varphi\left(r_{s}\right)\right) \cup$ $\operatorname{symcross}^{\left(\text {Slabel }_{p}\left(p\left(f_{i}\right)\right), \varphi\left(r_{s}\right)\right) \cup \varphi\left(m_{i}\right) \cup \varphi\left(m_{k}\right) \text {. We let } \varphi}$ be our solution as we see that it is a solution to $C\left(s_{1}\right)$ and satisfies constraints (80-82) and thus is a solution to $C(s)$. Additionally, from 10) we also see that $\varphi$ also extends $E$. From 9),10) and 11) we satisfy the remaining conditions of the conclusion.

We are now ready to prove Theorem 4, which we restate here:

Theorem (Equivalence) $\vdash p: E$ if and only if there exists a solution $\varphi$ of $C(p)$ where $\varphi$ extends $E$.

Proof. $\Leftarrow)$ We have a solution $\varphi$ of $C(p)$ where $\varphi$ extends $E$. From constraints (57-59) we have for all $f_{i}$ defined in $\left.p, 1\right) \varphi\left(r_{s_{i}}\right)=\emptyset$, 2) $\varphi\left(o_{i}\right)=\varphi\left(o_{s_{i}}\right)$ and 3) $\varphi\left(m_{i}\right)=\varphi\left(m_{s_{i}}\right)$. Substituting the premise that $\varphi$ extends $E$ in 2) and 3) gives us 4) $\varphi\left(o_{s_{i}}\right)=O_{i}$ and 5) $\varphi\left(m_{s_{i}}\right)=M_{i}$. Since $C\left(s_{i}\right) \subseteq C(p)$, we see that $\varphi$ is a solution to $C\left(s_{i}\right)$. Since $\varphi$ is a solution to $C\left(s_{i}\right)$ and $\varphi$ extends $E$ then using Lemma (18) with 1),4),5) and the premise we get for each $i$, 6) $p, E, \emptyset \vdash s_{i}: M_{i}, O_{i}$. Since $\varphi$ extends $E$ then for all $i$ 7) $E\left(f_{i}\right)=\left(\varphi\left(m_{i}\right), \varphi\left(o_{i}\right)\right)$. Substituting 2),3),4) and 5) in 7) gives us 8) $E\left(f_{i}\right)=\left(M_{i}, O_{i}\right)$ which is we can rewrite as 9) $E=\left\{f_{i} \mapsto\left(M_{i}, O_{i}\right)\right\}$. From 6) and 9) we may use Rule (45) to get $\vdash p: E$ as desired.
$\Rightarrow)$ From Rule (45) we have 1) $E=\left\{f_{i} \mapsto\left(M_{i}, O_{i}\right)\right\}$ and for all $i$ 2) $p, E, \emptyset \vdash s_{i}: M_{i}, O_{i}$. We apply for each $i$ Lemma (18) to 2) to get a solution $\varphi_{i}$ to $C\left(s_{i}\right)$ that extends $E$ and 3) $\left.\varphi_{i}\left(r_{s_{i}}\right)=\emptyset, 4\right) \varphi_{i}\left(o_{s_{i}}\right)=O_{i}$ and 5) $\varphi_{i}\left(m_{s_{i}}\right)=M_{i}$. Notice that all the $\varphi_{i}$ agree on their common domain. Let 6) $\varphi=\bigcup_{i} \varphi_{i}$, We will now show that $\varphi$ is a solution to $C(p)$. We have that $\varphi$ is a solution to each $C\left(s_{i}\right)$ and that $\varphi$ extends $E$. All we must show then is that constraints $(57-59)$ are satisfied. From 1) we see 7) $E\left(f_{i}\right)=\left(M_{i}, O_{i}\right)$. Since $\varphi$ extends $E$ and using the definition of extends we get 8) $E\left(f_{i}\right)=\left(\varphi\left(m_{i}\right), \varphi\left(o_{i}\right)\right)$. From 7) and 8) we get 9) $\varphi\left(m_{i}\right)=M_{i}$ and 10) $\varphi\left(o_{i}\right)=O_{i}$. From 3) and 6) we get 11) $\varphi\left(r_{s_{i}}\right)=\emptyset$. Using 4),6) and 10) we have 12) $\varphi\left(o_{s_{i}}\right)=O_{i}$. From 5),6) and 9) we have 13) $\varphi\left(m_{s_{i}}\right)=M_{i}$. Substituting 10) in 12) gives us 14) $\varphi\left(o_{s_{i}}\right)=\varphi\left(o_{i}\right)$. We substitute 9) in 13) to get 15) $\varphi\left(m_{s_{i}}\right)=\varphi\left(m_{i}\right)$. From 11),14) and 15) we see that constraints (57-59) are satisfied and since $\varphi$ extends $E$ we have reached our conclusion.
