- Sending emails
- Interacting on social media...
- Your browser often tells you what it is using:

## Secret Communication

## Secret Communication

## Secret Communication

## Secret Communication

## Secret Communication

## Secret Communication

- Historically, such mechanisms are called ciphers.

## Ciphers

## Ciphers

## Ciphers

$$
\begin{aligned}
& k \xlongequal{m=101 . .} \\
& E(k, m)
\end{aligned}
$$

## Ciphers

## Ciphers

## Ciphers

## Ciphers

## Ciphers

- $E, D$ are called encryption and decryption algorithms, and $k$, the secret key.

## Ciphers

- $E, D$ are called encryption and decryption algorithms, and $k$, the secret key.
- $E$ could be randomized, so that $c$ changes every time!

## Ciphers

- $E, D$ are called encryption and decryption algorithms, and $k$, the secret key.
- $E$ could be randomized, so that $c$ changes every time!
- Symmetric Cipher: $k$ is same for both $E$ and $D$.

## Historical Ciphers

# Historical Ciphers 

...all completely broken

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.
- Shift by any amount $k=1,2, \ldots, 25$.
- Decrypt by shifting back...

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.
- Shift by any amount $k=1,2, \ldots, 25$.
- Decrypt by shifting back...
- Example: encrypt ATTACK with Shift $1=$ BUUBDL.

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.
- Shift by any amount $k=1,2, \ldots, 25$.
- Decrypt by shifting back...
- Example: encrypt ATTACK with Shift $1=$ BUUBDL.
- Breaking Caesar Cipher:

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.
- Shift by any amount $k=1,2, \ldots, 25$.
- Decrypt by shifting back...
- Example: encrypt ATTACK with Shift $1=$ BUUBDL.
- Breaking Caesar Cipher:
- Brute force: try all 26 possible shifts.

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.
- Shift by any amount $k=1,2, \ldots, 25$.
- Decrypt by shifting back...
- Example: encrypt ATTACK with Shift $1=$ BUUBDL.
- Breaking Caesar Cipher:
- Brute force: try all 26 possible shifts.
- Visible patterns and letter frequencies: ATTACK $=$ BUUBDL and DEFEND $=$ EFGFOE

## Caesar Cipher

- Named after Julius Caesar who used it to communicate with his generals.
- You simply shift your alphabets by a fixed number...
- Shift by 1: letter A becomes B, B becomes C, ... Z becomes A.
- Shift by any amount $k=1,2, \ldots, 25$.
- Decrypt by shifting back...
- Example: encrypt ATTACK with Shift $1=$ BUUBDL.
- Breaking Caesar Cipher:
- Brute force: try all 26 possible shifts.
- Visible patterns and letter frequencies:

ATTACK $=$ BUUBDL and DEFEND $=$ EFGFOE

- Ciphertext only attack! (worst kind)

## Substitution Cipher

- Choose a random permutation of English alphabets...

## Substitution Cipher

- Choose a random permutation of English alphabets...
- $\{A \rightarrow T, B \rightarrow L, C \rightarrow K, \ldots, Z \rightarrow H\}$ (no repeating)

## Substitution Cipher

- Choose a random permutation of English alphabets...
- $\{A \rightarrow T, B \rightarrow L, C \rightarrow K, \ldots, Z \rightarrow H\}$ (no repeating)
- Encrypt: just map plaintext letters according to the substitiution (key)
- Decrypt: revert back using the same key

## Substitution Cipher

- Choose a random permutation of English alphabets...
- $\{A \rightarrow T, B \rightarrow L, C \rightarrow K, \ldots, Z \rightarrow H\}$ (no repeating)
- Encrypt: just map plaintext letters according to the substitiution (key)
- Decrypt: revert back using the same key
- Cannot break by brute forcing for the key:
\# possible keys =

## Substitution Cipher

- Choose a random permutation of English alphabets...
- $\{A \rightarrow T, B \rightarrow L, C \rightarrow K, \ldots, Z \rightarrow H\}$ (no repeating)
- Encrypt: just map plaintext letters according to the substitiution (key)
- Decrypt: revert back using the same key
- Cannot break by brute forcing for the key:
\# possible keys $=26$ !

## Substitution Cipher

- Choose a random permutation of English alphabets...
- $\{A \rightarrow T, B \rightarrow L, C \rightarrow K, \ldots, Z \rightarrow H\}$ (no repeating)
- Encrypt: just map plaintext letters according to the substitiution (key)
- Decrypt: revert back using the same key
- Cannot break by brute forcing for the key:
$\#$ possible keys $=26!\approx 2^{88}$

## Substitution Cipher

- Choose a random permutation of English alphabets...
- $\{A \rightarrow T, B \rightarrow L, C \rightarrow K, \ldots, Z \rightarrow H\}$ (no repeating)
- Encrypt: just map plaintext letters according to the substitiution (key)
- Decrypt: revert back using the same key
- Cannot break by brute forcing for the key:
$\#$ possible keys $=26!\approx 2^{88}$
- Break by frequency analysis

## Frequency Analysis

- Frequency of letters, bigrams, double letters in English:

| Letters |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| e | $\mathbf{t}$ | $\mathbf{a}$ | $\mathbf{o}$ | $\mathbf{i}$ | $\mathbf{n}$ | $\mathbf{s}$ | $\mathbf{r}$ | $\mathbf{h}$ |
| $12.49 \%$ | $9.28 \%$ | $8.04 \%$ | $7.64 \%$ | $7.57 \%$ | $7.23 \%$ | $6.51 \%$ | $6.28 \%$ | $5.05 \%$ |

| Bigrams |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| th | he | in | er | an | re | on | at | en | nd | ti | es |
| 3.66\% | 3.08\% | 2.43\% | 2.05\% | 1.99\% | 1.85\% | 1.76\% | 1.49\% | 1.45\% | 1.35\% | 1.34\% | 1.34\% |

| Double Letters |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| II | 55 | ee | oo | tt | ff | pp | rr | mm | cc | nn |
| 0.58\% | 0.41\% | 0.38\% | 0.21\% | 0.17\% | 0.15\% | 0.14\% | 0.12\% | 0.10\% | 0.08\% | 0.07\% |

- Breaking substitution cipher

## Frequency Analysis

- Frequency of letters, bigrams, double letters in English:

| Letters |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| e | $\mathbf{t}$ | $\mathbf{a}$ | $\mathbf{o}$ | $\mathbf{i}$ | $\mathbf{n}$ | $\mathbf{s}$ | $\mathbf{r}$ | $\mathbf{h}$ |
| $12.49 \%$ | $9.28 \%$ | $8.04 \%$ | $7.64 \%$ | $7.57 \%$ | $7.23 \%$ | $6.51 \%$ | $6.28 \%$ | $5.05 \%$ |

| Bigrams |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| th | he | in | er | an | re | on | at | en | nd | ti | es |
| 3.68\% | 3.08\% | 2.43\% | 2.05\% | 1.99\% | 1.85\% | 1.76\% | 1.49\% | 1.45\% | 1.35\% | 1.34\% | 1.34\% |

| Double Letters |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| II | s5 | ee | 00 | tt | ff | pp | rr | mm | cc | nn |  |  |  |  |  |  |  |  |  |
| $0.58 \%$ | $0.41 \%$ | $0.38 \%$ | $0.21 \%$ | $0.17 \%$ | $0.15 \%$ | $0.14 \%$ | $0.12 \%$ | $0.10 \%$ | $0.08 \%$ | $0.07 \%$ |  |  |  |  |  |  |  |  |  |

- Breaking substitution cipher (ciphertext only attack):

## Frequency Analysis

- Frequency of letters, bigrams, double letters in English:

| Letters |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| $\mathbf{e}$ | $\mathbf{t}$ | $\mathbf{a}$ | $\mathbf{o}$ | $\mathbf{i}$ | $\mathbf{n}$ | $\mathbf{s}$ | $\mathbf{r}$ | $\mathbf{h}$ |  |
| $12.49 \%$ | $9.28 \%$ | $8.04 \%$ | $7.64 \%$ | $7.57 \%$ | $7.23 \%$ | $6.51 \%$ | $6.28 \%$ | $5.05 \%$ |  |

| Bigrams |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: |
| th | he | in | er | an | re | on | at | en | nd | ti | es |  |  |  |  |  |
| $3.56 \%$ | $3.08 \%$ | $2.43 \%$ | $2.05 \%$ | $1.89 \%$ | $1.85 \%$ | $1.76 \%$ | $1.49 \%$ | $1.45 \%$ | $1.35 \%$ | $1.34 \%$ | $1.34 \%$ |  |  |  |  |  |

| Double Letters |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| II | s5 | ee | 00 | tt | ff | pp | rr | mm | cc | nn |  |  |  |  |  |  |  |  |  |
| $0.58 \%$ | $0.41 \%$ | $0.38 \%$ | $0.21 \%$ | $0.17 \%$ | $0.15 \%$ | $0.14 \%$ | $0.12 \%$ | $0.10 \%$ | $0.08 \%$ | $0.07 \%$ |  |  |  |  |  |  |  |  |  |

- Breaking substitution cipher (ciphertext only attack): - Collect a long ciphertext - frequency patterns will not change.

## Frequency Analysis

- Frequency of letters, bigrams, double letters in English:

| Letters |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| e | $\mathbf{t}$ | a | o | i | $\mathbf{n}$ | $\mathbf{s}$ | $\mathbf{r}$ | h |  |
| $12.49 \%$ | $9.28 \%$ | $8.04 \%$ | $7.64 \%$ | $7.57 \%$ | $7.23 \%$ | $6.51 \%$ | $6.28 \%$ | $5.05 \%$ |  |

| Bigrams |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: |
| th | he | in | er | an | re | on | at | en | nd | ti | es |  |  |  |  |  |
| $3.56 \%$ | $3.08 \%$ | $2.43 \%$ | $2.05 \%$ | $1.89 \%$ | $1.85 \%$ | $1.76 \%$ | $1.49 \%$ | $1.45 \%$ | $1.35 \%$ | $1.34 \%$ | $1.34 \%$ |  |  |  |  |  |

| Double Letters |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| II | 55 | ee | 00 | tt | ff | pp | rr | mm | cc | nn |
| 0.58\% | 0.41\% | 0.38\% | 0.21\% | 0.17\% | 0.15\% | 0.14\% | 0.12\% | 0.10\% | 0.08\% | 0.07\% |

- Breaking substitution cipher (ciphertext only attack):
- Collect a long ciphertext - frequency patterns will not change.
- Compute frequencies of various letters

## Frequency Analysis

- Frequency of letters, bigrams, double letters in English:

| Letters |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| e | $\mathbf{t}$ | $\mathbf{a}$ | $\mathbf{o}$ | $\mathbf{i}$ | $\mathbf{n}$ | $\mathbf{s}$ | $\mathbf{r}$ | $\mathbf{h}$ |  |
| $12.49 \%$ | $9.28 \%$ | $8.04 \%$ | $7.64 \%$ | $7.57 \%$ | $7.23 \%$ | $6.51 \%$ | $6.28 \%$ | $5.05 \%$ |  |

| Bigrams |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| th | he | in | er | an | re | on | at | en | nd | ti | es |  |  |  |  |  |  |  |
| $3.56 \%$ | $3.08 \%$ | $2.43 \%$ | $2.05 \%$ | $1.99 \%$ | $1.85 \%$ | $1.76 \%$ | $1.49 \%$ | $1.45 \%$ | $1.35 \%$ | $1.34 \%$ | $1.34 \%$ |  |  |  |  |  |  |  |

| Double Letters |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| II | 55 | ee | 00 | tt | ff | pp | rr | mm | cc | nn |
| 0.58\% | 0.41\% | 0.38\% | 0.21\% | 0.17\% | 0.15\% | 0.14\% | 0.12\% | 0.10\% | 0.08\% | 0.07\% |

- Breaking substitution cipher (ciphertext only attack):
- Collect a long ciphertext - frequency patterns will not change.
- Compute frequencies of various letters
- Reconstruct the key: most frequent letter represents "E", second most is "T", etc. Use bigrams, trigrams, etc. for more.

## Frequency Analysis

- Frequency of letters, bigrams, double letters in English:

| Letters |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| e | $\mathbf{t}$ | $\mathbf{a}$ | $\mathbf{o}$ | $\mathbf{i}$ | $\mathbf{n}$ | $\mathbf{s}$ | $\mathbf{r}$ | $\mathbf{h}$ |  |
| $12.49 \%$ | $9.28 \%$ | $8.04 \%$ | $7.64 \%$ | $7.57 \%$ | $7.23 \%$ | $6.51 \%$ | $6.28 \%$ | $5.05 \%$ |  |

| Bigrams |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| th | he | in | er | an | re | on | at | en | nd | ti | es |  |  |  |  |  |  |  |
| $3.56 \%$ | $3.08 \%$ | $2.43 \%$ | $2.05 \%$ | $1.99 \%$ | $1.85 \%$ | $1.76 \%$ | $1.49 \%$ | $1.45 \%$ | $1.35 \%$ | $1.34 \%$ | $1.34 \%$ |  |  |  |  |  |  |  |

| Double Letters |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| II | 55 | ee | 00 | tt | ff | pp | IT | mm | cc | nn |
| 0.58\% | 0.41\% | 0.38\% | 0.21\% | 0.17\% | 0.15\% | 0.14\% | 0.12\% | 0.10\% | 0.08\% | 0.07\% |

- Breaking substitution cipher (ciphertext only attack):
- Collect a long ciphertext - frequency patterns will not change.
- Compute frequencies of various letters
- Reconstruct the key: most frequent letter represents "E", second most is "T", etc. Use bigrams, trigrams, etc. for more.
- Great blogpost about this: http://norvig.com/mayzner.html

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword = CAB

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length $26: \mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length 26: $\mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length 26: $\mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.
- HELLO (message)

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length 26: $\mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.
- HELLO (message)
- CABCA (repeated key to match the length)

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length 26: $\mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.
- HELLO (message)
- CABCA (repeated key to match the length)
- JEMNO (ciphertext)

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword = CAB
- Alphabets in an array of length 26: $\mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.
- HELLO (message)
- CABCA (repeated key to match the length)
- JEMNO (ciphertext)
- $\mathrm{H} \rightarrow \mathrm{J}, \mathrm{E} \rightarrow \mathrm{E}, \mathrm{L} \rightarrow \mathrm{M}, \mathrm{L} \rightarrow \mathrm{N}, \mathrm{O} \rightarrow \mathrm{O}$

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length 26: $\mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.
- HELLO (message)
- CABCA (repeated key to match the length)
- JEMNO (ciphertext)
- $\mathrm{H} \rightarrow \mathrm{J}, \mathrm{E} \rightarrow \mathrm{E}, \mathrm{L} \rightarrow \mathrm{M}, \mathrm{L} \rightarrow \mathrm{N}, \mathrm{O} \rightarrow \mathrm{O}$
- Again, easily broken by frequency analysis: guess key length and analyze frequencies.

## Vigenère Cipher

- Use a random keyword to shift. Repeat to match length.
- Keyword $=$ CAB
- Alphabets in an array of length $26: \mathrm{A}=0, \mathrm{~B}=1, \mathrm{C}=2, \ldots, \mathrm{Z}=25$.
- Shift for the keyword $\mathrm{CAB}=201$.
- HELLO (message)
- CABCA (repeated key to match the length)
- JEMNO (ciphertext)
- $\mathrm{H} \rightarrow \mathrm{J}, \mathrm{E} \rightarrow \mathrm{E}, \mathrm{L} \rightarrow \mathrm{M}, \mathrm{L} \rightarrow \mathrm{N}, \mathrm{O} \rightarrow \mathrm{O}$
- Again, easily broken by frequency analysis: guess key length and analyze frequencies.
- Ciphertext only attack!

## Rotor Machines

- After the typewriter, encryption based on rotor machines.

The Hebern Machine (Wikipedia)

## Rotor Machines

- After the typewriter, encryption based on rotor machines.

The Hebern Machine (Wikipedia)

- Rotor encodes the key
- Typed symbol encrypted with the next symbol on the rotor

## Rotor Machines

- After the typewriter, encryption based on rotor machines.

The Hebern Machine (Wikipedia)

- Rotor encodes the key
- Typed symbol encrypted with the next symbol on the rotor
- Rotor moves as you type, changing the key each time.
- Measure the cycle after which the key starts repeating

## Rotor Machines

- Machines with more rotors, more rotors = bigger key space.

Enigma with 3 rotors (Wikipedia)

## Rotor Machines

- Machines with more rotors, more rotors = bigger key space.

Enigma with 3 rotors (Wikipedia)

- More rotors = more keys

## Rotor Machines

- Machines with more rotors, more rotors = bigger key space.

Enigma with 3 rotors (Wikipedia)

- More rotors $=$ more keys $\approx 2^{36}$ in Enigma with 3-rotors.
- All susceptible to known cryptanalysis methods
- Friedman had several important cryptanalysis methods for Hebern.
- Further improved and highly optimized by others.
- Turing designed a machine to search for Enigma key from known ciphertexts/plaintext pairs.

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys,

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys,

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys, not considered safe with today's computing powers.

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys, not considered safe with today's computing powers.
- Advanced Encryption Standard (AES):

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys, not considered safe with today's computing powers.
- Advanced Encryption Standard (AES):
- Designed by Vincent Rijmen and Joan Daemen (originally called Rijndael) in 1998.

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys, not considered safe with today's computing powers.
- Advanced Encryption Standard (AES):
- Designed by Vincent Rijmen and Joan Daemen (originally called Rijndael) in 1998.
- Selected and standardized by the US government through intense competition

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys, not considered safe with today's computing powers.
- Advanced Encryption Standard (AES):
- Designed by Vincent Rijmen and Joan Daemen (originally called Rijndael) in 1998.
- Selected and standardized by the US government through intense competition
- Comes with different key sizes and other parameters (typical for such ciphers)

## Digital Age

- Data Encryption Standard (DES), designed by IBM in response to government's call for a good encryption standard, in 1974.
- DES has roughly $2^{56}$ keys, not considered safe with today's computing powers.
- Advanced Encryption Standard (AES):
- Designed by Vincent Rijmen and Joan Daemen (originally called Rijndael) in 1998.
- Selected and standardized by the US government through intense competition
- Comes with different key sizes and other parameters (typical for such ciphers)
- Many other ciphers known today, e.g., Salsa, Twofish, ...

## Next class

- What does it mean for a cipher to be secure?
- Shannon's treatment of perfect secrecy.
